† Continuation of Judkins record.

This issue contains additional precipitation data for the storms of September 23-24 and 24-25 on page 219.

REFERENCE NOTE

The four digit identification numbers in the index number column of the Station Index are assigned [illegible] in a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in tenths and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either [illegible].

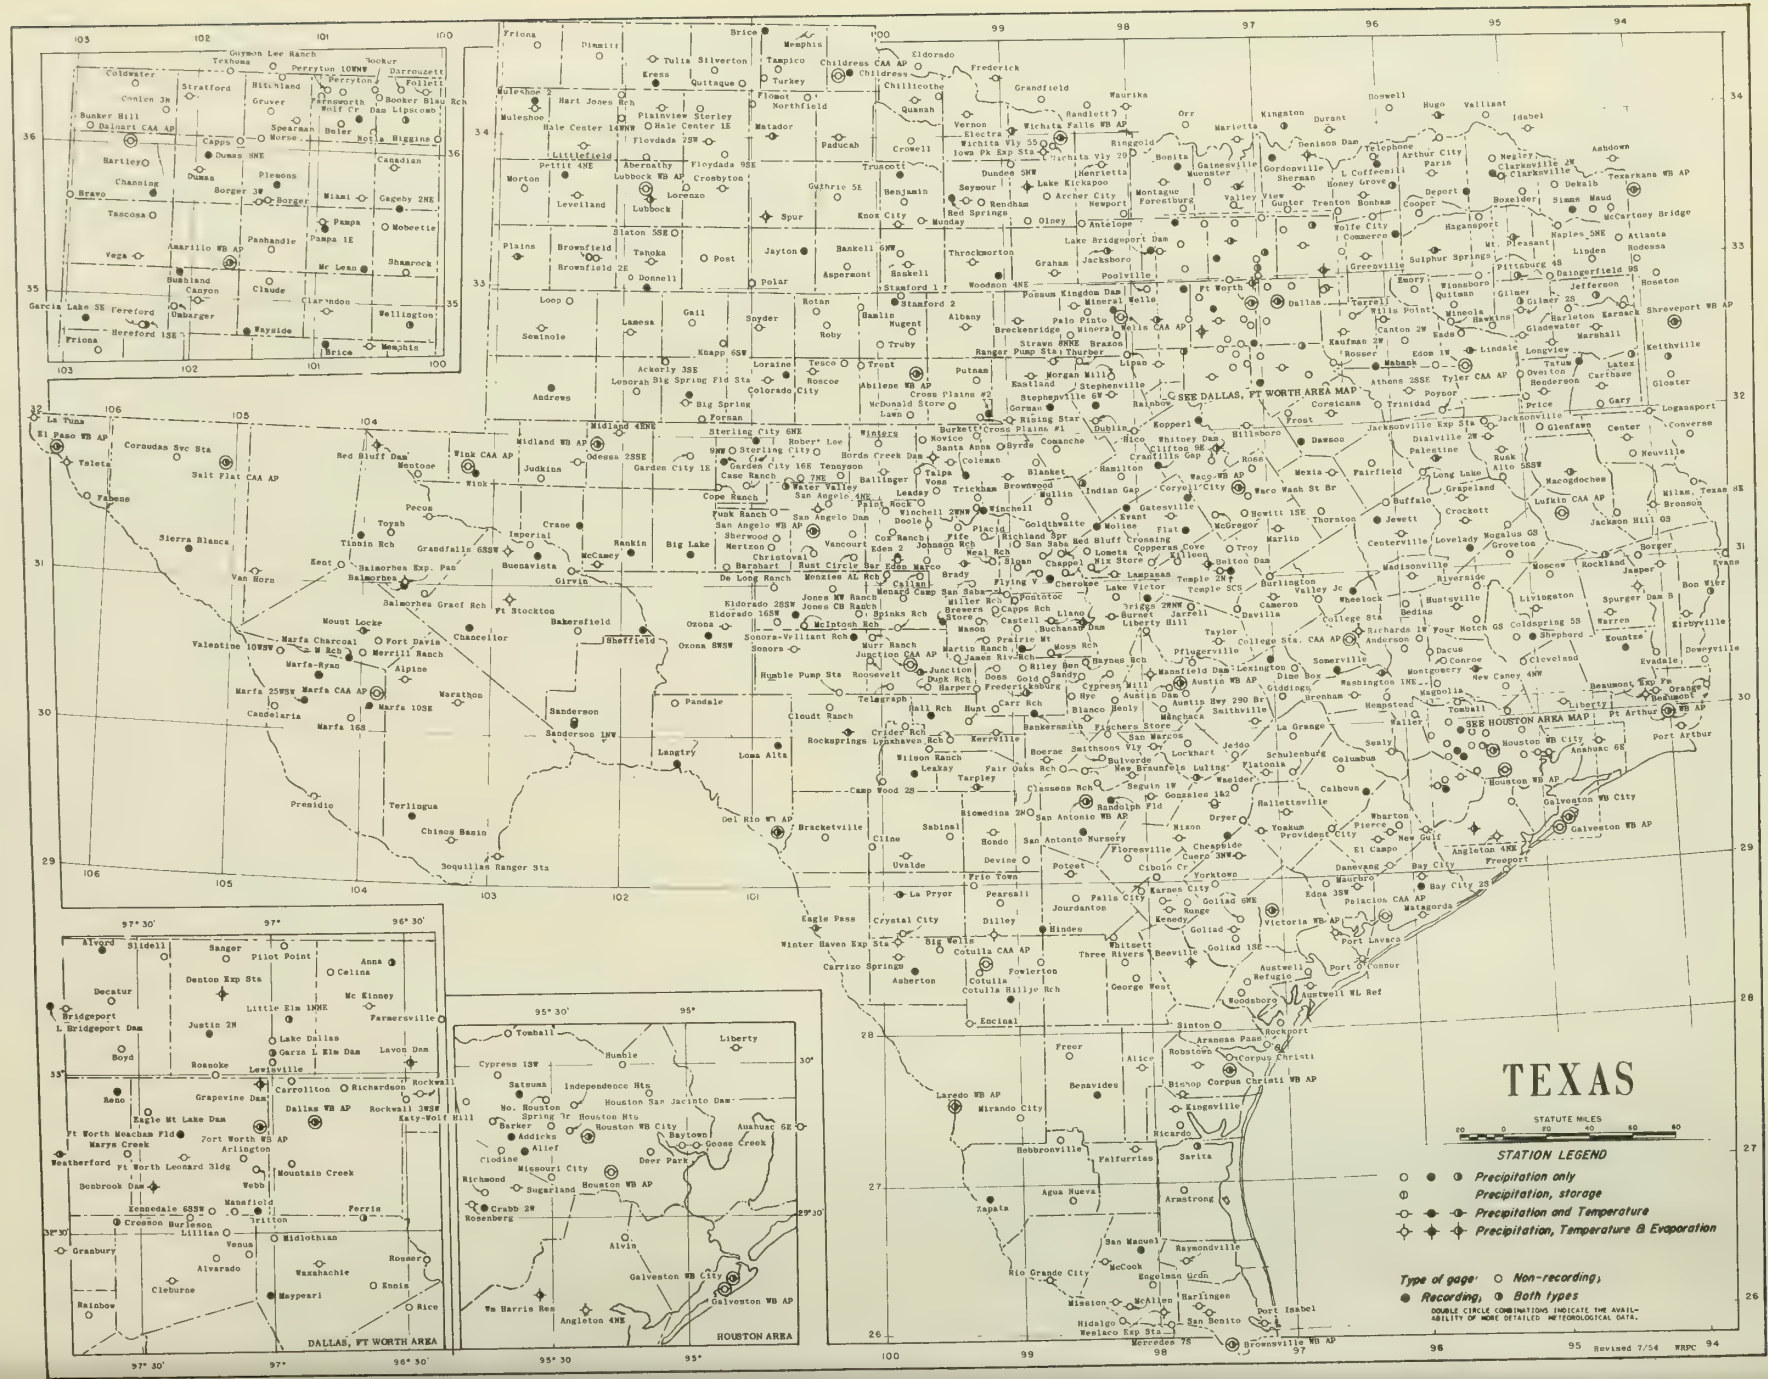
Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by [illegible].

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.



Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, Box 4089, Houston 14, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	**Amount included in following measurement, time distribution unknown.**
@	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	**Gage is equipped with a windshield.**
AM	**Data based on observational day ending before noon.**
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	**Trace, an amount too small to measure.**
V	**Includes total for previous month.**
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the **Superintendent of Documents.** Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, **Government Printing Office, Washington 25, D. C.**

TEXAS

OCTOBER 1955
Volume LX No. 10

ASHEVILLE: 1955

TEXAS - OCTOBER 1955

WEATHER SUMMARY

Temperatures during October averaged 67.1° or 0.3° above normal. Precipitation averaged 1.38 inches or 56% of normal. Open weather during the last three weeks of October permitted farmers to catch up with their harvest operations, and most crops were out of the fields by the end of the month except in the western and northwestern districts.

The first few days of October were warmer than normal over most of Texas. Temperatures in the El Paso area were slightly below normal. A cold front moved across the State on the 6th dropping temperatures to several degrees below normal. Temperatures returned to several degrees above normal by the 11th and a second cold front, which crossed Texas on the 12th and 13th, brought another cool spell. Frontal action brought cooler air into the State on the 16th, 24th, and 28th. Freezing temperatures hit the Panhandle and the Edwards Plateau on the 24th and 25th. The coolest days came on the 17th and 18th at some stations along the Gulf, but to most stations elsewhere on the 24th to 26th and during the last few days. The lowest temperature for the State, 24°, occurred at Stratford on the 30th. Monthly minimums were above 35° in the Rio Grande Valley and over much of southern Texas. Brownsville's lowest temperature was 53°. Temperatures at Galveston did not drop below 54° during the month. Most stations registered their warmest temperatures during the first few days. Some stations in the Panhandle registered their monthly maximums on the 19th to 21st. The highest temperature for the State, 98°, occurred at Jasper on the 10th. Monthly mean temperatures ranged from 58.0° at Mount Locke to 76.6° at Port Isabel. Monthly mean temperatures over most of southern and eastern Texas and at some stations in the western Panhandle were below normal. Most stations in the north central part of the State and in the eastern part of the Panhandle had above-normal monthly averages.

Thundershowers dumped several inches of rain locally over the southern High Plains and over the Low Rolling Plains. Light to moderate local showers fell over some other parts of Texas during the first few days of October. A few light to moderate scattered showers fell in the Lower Rio Grande Valley on the 10th and 11th, in extreme northeastern Texas on the 12th, in the Coastal Bend on the 27th and along the Upper Coast and in East Texas on the 28th. Most other days were rainless. Several stations received no rain during the entire month and others received only a few sprinkles. In general, monthly totals exceeded 1.00 inch over the Lower Valley, Coastal Bend, and extreme East Texas; also over the southern High Plains and the Low Rolling Plains. A few stations in northeastern Texas and many stations in the southern High Plains and the northern Low Rolling Plains received more than 4.00 inches. The greatest monthly total was 10.55 inches at Plains. Several stations near Plains and others in the Quanah vicinity received more than 6.00 inches of rain during the month. Rainfall was below normal over most of the State. The main areas which received more than normal amounts were the southern High Plains, the northern Low Rolling Plains, the extreme northeast Texas, a few stations in the Lower Valley, and a few stations in western Texas. A rather large central area, including most of the Blacklands, Cross Timbers, and South Central Texas, lacked more than 2.00 imches of receiving the normal rainfall for October.

Light showers to flooding rains interrupted field work during the first week of October. Wheat planting passed the peak, however, in the northern High Plains where the showers were widely scattered. Seed which had been "dusted in" in September came up to good stands and made good growth and some fields of volunteer wheat in the northern Low Rolling Plains were grazed. Corn picking neared completion in the south central and Blacklands counties and growers wound up the cotton harvest in the south central and upper coastal areas with stalk destruction following close behind. Activity on Texas farms continued at a fall peak during the ideal harvest weather of the last three weeks of October, but small grains, winter legumes, and pastures over practically the entire State needed rains. Freezing temperatures occurred over the High Plains, the northern Low Rolling Plains, and parts of the Plateau and the Trans-Pecos. Frosts stopped the development of cotton over most western and northwestern counties. Planting vegetables for winter harvest was especially active in the commercial vegetable areas of south Texas. Ranges were dry and pasture feed was getting short in the Cross Tibers, Plateau areas, and eastward across the State. Livestock required supplemental feeding in south central and southwestern counties where only light rains fell in late September and in October. Much of the State, especially the eastern two-thirds, needed more rains to bring on small grain pastures and start winter weeds and grasses for forage.

FLOODS

About 50 blocks of residential property and about 100 blocks of unimproved land and park area in Wichita Falls were flooded by backwater from the main stem of the Wichita River as the crest was reached on the night of October 4th and 5th. About 500 families had been evacuated.

Lucius W. Dye

STORMS

On the 4th, a wind and hail storm near Crosbyton damaged two farm homes and left heavy crop damage, amounting to $250,000, while property damage was estimated at $15,000.

On the 6th, a pilot reported three funnel-shaped clouds between Athens and Frankston in Henderson County. No damage was reported in the area.

On the 28th, lightning started a fire that destroyed a large barn near Savoy (Fannin County). No estimate of damage was obtained.

C. B. Crooker

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, Box 4089, Houston 14, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

TEXAS

NOVEMBER 1955
Volume LX No. 11

ASHEVILLE: 1956

TEXAS - NOVEMBER 1955

WEATHER SUMMARY

Several brief periods of cool and mild weather alternated during the month to produce temperatures that averaged 55.4 degrees or 0.3 degree below normal. Rainfall averaged 0.62 inch or approximately one-third of normal. Winter ranges deteriorated and the need for supplemental feeding of livestock increased. High winds and lack of rain hurt the wheat in the Plains. Commercial vegetables progressed satisfactorily in South Texas and supplies increased.

The first few days of November were quite warm over much of Texas. Other warm periods were the 11th to 15th and the 20th to 22d. Most stations registered their highest temperatures during the first few days. Monthly maximums ranged from 70 degrees at Mount Locke to 94 degrees at McCook, Encinal, and Rio Grande City. The most important cold spells were the 7th to 10th, 16th to 17th, and the last three days. Most stations registered their lowest temperatures during these periods. Monthly minimums ranged from near zero over the Panhandle to the middle and upper 30's near the Gulf. The coldest temperature for the State, 5 degrees, occurred at Follett on the 16th.

Scattered local showers occurred on several days during the month. The more generous amounts fell on the 7th, 8th, 9th,,16th, and 30th. Daily amounts were generally light. Many stations received no rain during the entire month. Most stations over the Blacklands, Cross Timbers, Plains, and the northern parts of the Trans-Pecos and Edwards Plateau received less than 0.50 inch. Only southern Texas, eastern Texas, and the northern part of the Upper Coast received more than 1.00 inch. A few stations from Bronson southward to Port Arthur received more than 3.00 inches. The greatest total, 4.68 inches, fell at Bon Wier. A few stations in South Texas and a few in West Texas received more than normal rainfall. Almost all stations elsewhere received less than normal. The greatest deficiencies were in East Texas from Galveston and Houston northward to Kaufman and Linden. Snow fell over parts of the Plains, Trans-Pecos, and Edwards Plateau but generally in light amounts. The greatest total, 6.0 inches, fell at Crider Ranch and at Mertzon.

Several northers whistled across Texas during November, each in its turn temporarily curtailing outside farm work. Wheat made poor progress and furnished little feed for livestock. Dry grass became short and supplemental feeding of livestock increased. Hay and bundle feeds were generally ample and livestock continued in good condition. Stockers and feeders moved in heavy volume during most of the month. Conditions continued fairly favorable in most commercial vegetable areas of the south. Planting of late winter vegetables was active and the supplies of fall and early winter vegetables increased. The cold snap on the morning of the 29th did not damage the tender vegetables at Laredo and in the Lower Valley. Rains over the eastern part of Texas revived hopes for small grains that had been struggling to survive.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, Box 4089, Houston 14, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

TEXAS

DECEMBER 1955
Volume LX No. 12

UNIVERSITY OF ILLINOIS

ASHEVILLE: 1956

TEXAS - DECEMBER 1955

WEATHER SUMMARY

December was very dry. Rainfall averaged 0.71 inch or slightly more than one-third of normal. Temperatures averaged 49.4° or 1.4° above normal. The open weather enabled growers in late districts to complete the harvest of cotton and small grains without significant losses. Dry range and pasture feed reserves were about eaten out and the supplemental feeding of hay, bundle feed and cake was stepped up to offset the vanishing dry range and pasture feed. The weather conditions during December were generally favorable for all commerical vegetable crops except lettuce and spinach. Texas citrus were of good quality and holiday demand was unusually heavy.

The first two days of December were relatively mild. A cold front on the 3d preceded a norther which pushed the 32° isotherm as far south as the Winter Garden and southeastward toward the Coast. Other cold fronts crossed the State on the 7th and 14th, each in its turn dropping the temperatures to below normal for the season. Minimum temperatures following this front ranged from under 10° in the Panhandle to the 20's in the central part of Texas, to near 30° near the Coast and over south Texas except in the Lower Rio Grande Valley where minimums remained above freezing. Most stations over eastern and southern Texas registered lower temperatures on the 15th and 16th than on the 9th. The lowest temperature for the State, 4° above zero, occurred at Plainview on the 15th. Another cold front on the 19th brought low temperatures over eastern and southern Texas. Temperatures began a rapid rise on the 21st and maximums on the 24th and 25th reached the high 80's and low 90's over a wide band across central Texas from north to south. Maximums below 85° were common east and west of this band. The highest for the State, 93°, occurred at Coleman and La Pryor on the 24th and at Hondo, La Pryor, and Uvalde on the 25th. A frontal passage on the 25th and 26th brought lower temperatures to most of Texas except the Panhandle. The last front of the month preceded cooler weather on the 29th over the north, 30th over the west, and 30th and 31st over the east. In general, the first half of the month was relatively cool and the last half averaged warmer than normal. Monthly mean temperatures ranged from 34.0° at Follett to 64.4° at Port Isabel. Mean monthly temperatures were below normal at a few stations but, in general, they averaged above normal. The greatest departures were over the Trans-Pecos.

Light scattered showers occurred on several days during December but the more important amounts fell on the 1st, 29th, and 30th. In general, monthly amounts ranged from none to 0.50 inch over the western half of the State and from 0.50 to 2.00 inches over the eastern half except a few counties in the vicinity of Port Arthur received more than 3.00 inches during December. The greatest monthly amount, 6.71 inches, fell at Anahuac 6E. Anahuac 6E and Orange received more than their December normals. Elsewhere, below-normal precipitation was the rule. The greatest deficiencies occurred in the northeastern part of the State. Snowfall during December was of little consequence except at a few localities in the Panhandle and in western Texas. Clarendon received the greatest amount, 3.5 inches.

General rains over the eastern half of the State on the 1st revived hopes for small grains that had been struggling to survive. They also gave a big boost to clover and rescue grass. The rains tapered out to the west and the low Rolling Plains and the Western Plateau received only ineffective light rains and the High Plains none. Irrigated wheat on the High Plains made good development but dryland wheat continued to decline. The heavy rains delayed field work in the commercial vegetable areas. Supplemental feeding of livestock increased over most of the State as the dry range grass became short. Marketing of stockers and feeders increased. Marketings of Texas citrus increased in response to the pre-Christmas demand. As the year drew to a close, farm activity was seasonally slow in the south Texas winter vegetable and citrus area, and was confined principally to the care of livestock. Rain was needed in all parts of the State. Dryland wheat was holding on surprisingly well in the northwest although surface moisture had become depleted. High Plains irrigated wheat continued in good condition. In the Blacklands, central and east Texas, most small grains had fair to good color but vegetative growth was short and the need for rain was urgent. Heavy supplemental feeding of livestock continued.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name such as 12 SSW indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated dimensional units used in this bulletin are temperature in F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65 F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

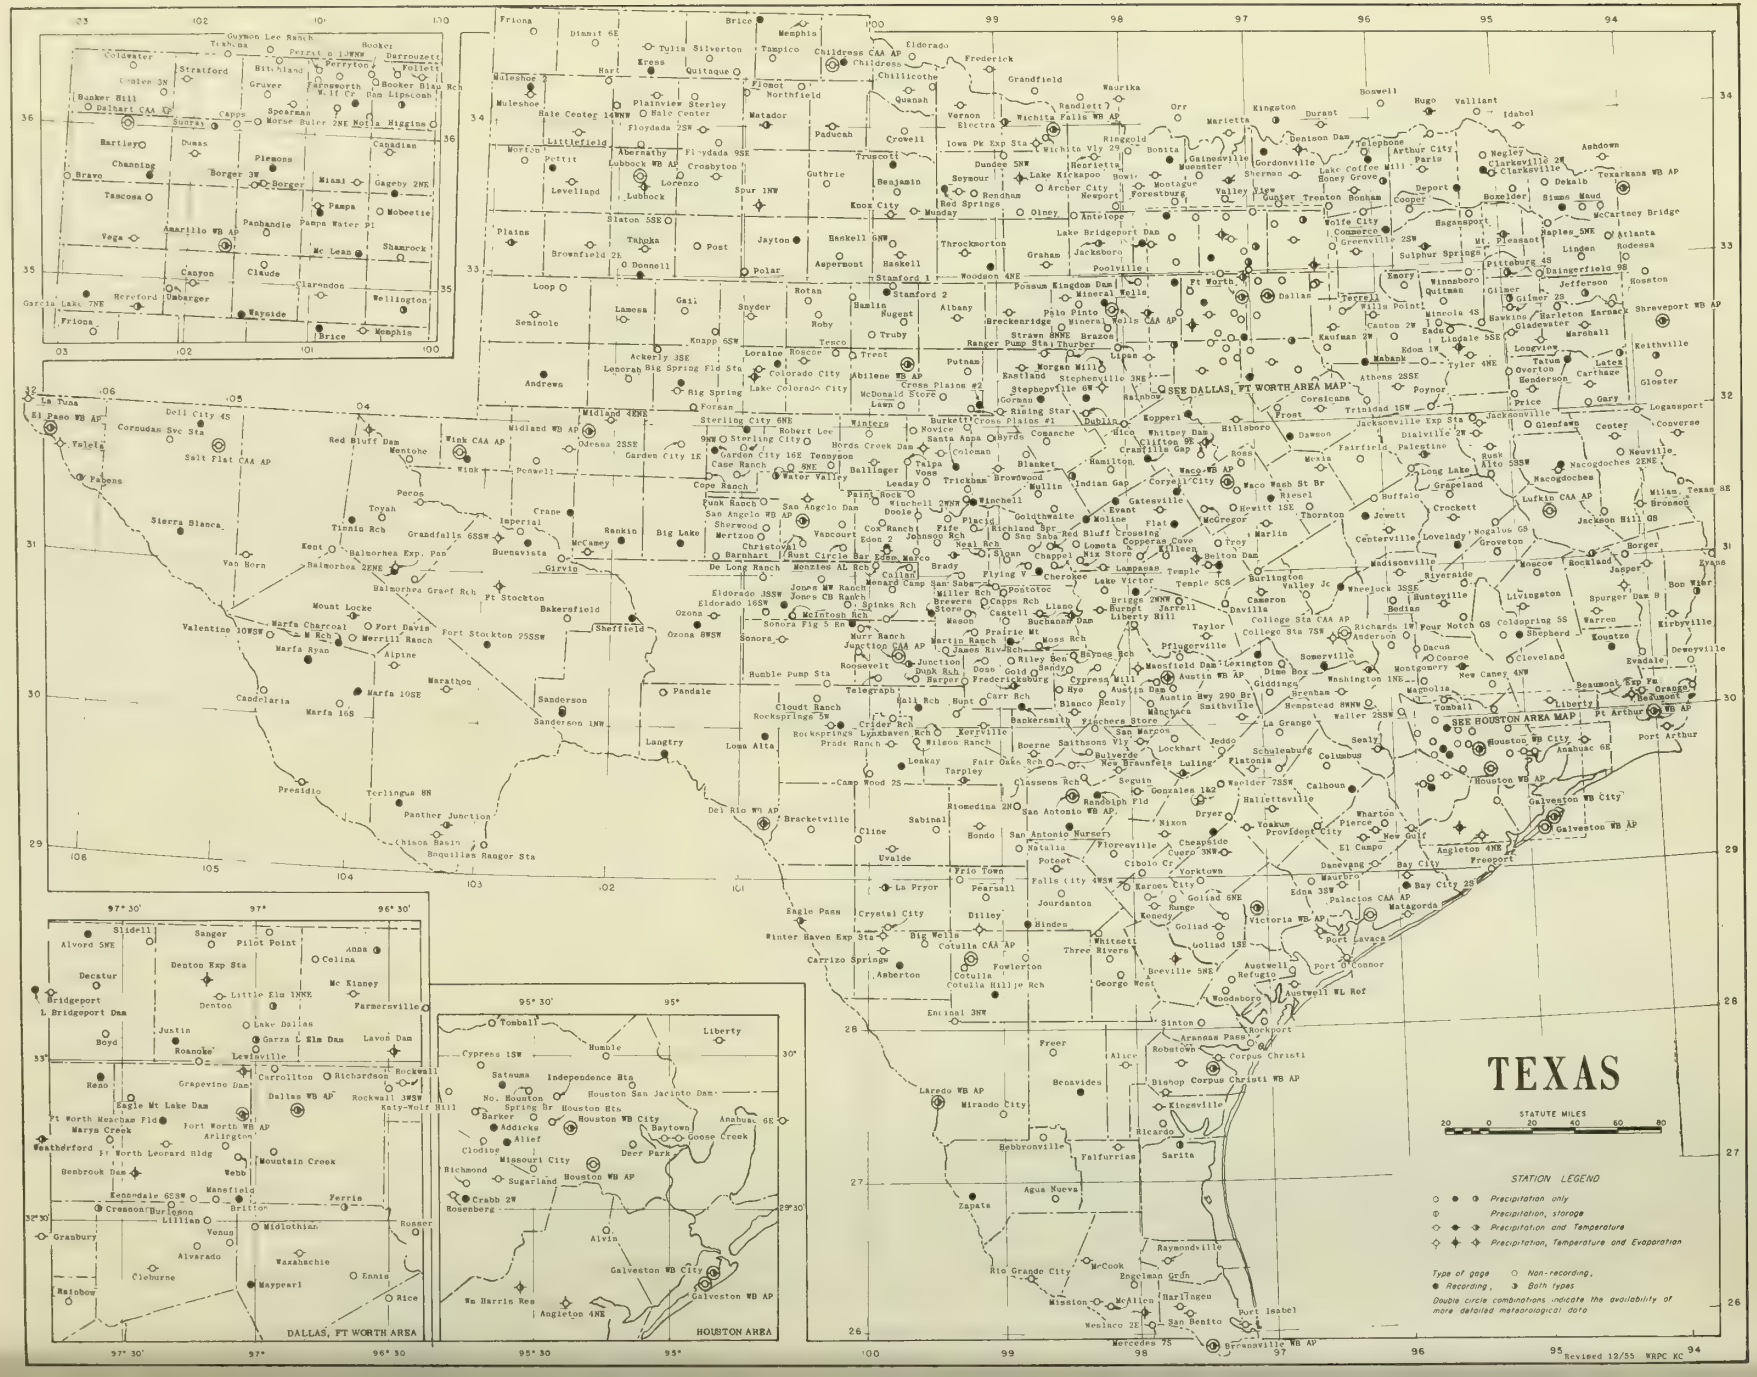
Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office Box 1089 Houston 14, Texas.



-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ANNUAL SUMMARY 1955

Volume LX No. 13

ASHEVILLE: 1956

TEXAS - 1955

WEATHER SUMMARY

1955 was the fifth year of above-average temperatures and the sixth of below-normal precipitation. Relative improvement was shown by temperatures closer to normal than any year since 1952 and precipitation deficiencies about one-half of the 1954 amount. The average temperature for the State during 1955 was 66.0°, 0.7° above normal. Precipitation was 82 percent of normal, a deficit of 4.85 inches for the year.

Livestock valuation was up $50,000,000 from a year ago with cattle accounting for 83 percent of total valuation of $732,000,000. Sheep represented eight percent of the total. Large calf crops and modest restocking permitted heavy marketing and simultaneous increase in herd strength, according to the USDA Agricultural Marketing Service. Ranges and pastures as a whole were better than any year since 1951 but still were short of pre-drought conditions. Cattle numbers were up one percent from 1954 but milk cows were fewer than at any time during the last fifty years. Sheep population fell seven percent below 1954 mainly because of adverse weather affecting ranges in the Edwards Plateau and Trans Pecos. Increased numbers were reported from farming areas in the Blacklands area, however.

Crops, down seven percent from 1954, were valued at $1,237,000,000. Corn volume was up 53 percent from 1954, although the March freeze caused extensive replanting. Yields were the highest since 1908 but the crop was short in drought-stricken south Texas. Wheat volume was the smallest in 20 years, due to prolonged winter and a dry spring in the High Plains. Cotton was slightly above 1954 volume with yields above both 1954 and the 10-year average. Rice was down 13 percent from the record high of the previous year in spite of record yields. Oats and barley were reduced by freeze and drought to two-thirds of the 1954 level. Peanuts were drastically curtailed by drought in South Texas but, along with sweet potatoes, doubled the 1954 production figures. Spring freezes nearly wiped out the fruit crop and abruptly reduced pecan production.

January and July temperatures were exactly normal while the state-wide means for February, June, August and November were below normal. April showed the greatest deviation from normal with +3.7° February and June with a -1.1° difference had the largest negative departure. The highest annual mean, 74.8°, was shared by Harlingen and Laredo WB AP while Dalhart CAA AP produced the coolest mean, 55.9°. Deviations from annual means ranged between a +2.5° at Synder and -2.2° at Follett. Presidio observed the highest temperature of the year, 113°, on three days in June, the 8th, 25th, and 26th while the lowest temperature in the State -1.0° also repeated on February 20th and 21st at Stratford. The highest monthly mean was 88.0° during August at Laredo WB AP while the extreme in the other direction was 33.0° during February at Stratford. Generally speaking these statistics were representative with colder temperatures in the Panhandle and warmer temperatures in the Big Bend or southern section. Rio Grande City observed 202 days with the maximum temperature at or above 90° while Dalhart CAA AP reported 141 days with the minimum temperature at or below freezing. February was the coolest record month since 1948. March freezes which extended to all areas except the Gulf Coast and extreme south, did widespread damage in the Lower Valley and Coastal Bend. May was the warmest since 1933 while June was coolest since 1941.

Precipitation was scattered as to monthly distribution as well as area. Some favored areas received more than expected. Others were marginal and many places were badly in need of surface water as well as sub soil moisture. February, May, July-September were all above normal precipitation marks on a state-wide basis. February received a 0.33 inch surplus, 21 percent above normal while November-December were driest with 34 and 35 percent of normal respectively. Extremes in annual precipitation amounts were 65.34 inches at Bon Wier and 5.74 at Fabens. The maximum departure from the annual total was -16.41 inches at Anderson while the greatest positive departure was 11.26 at Chillicothe. The highest monthly precipitation amount was 17.22 inches during August at Anahuac 6E, the least was no precipitation reported by several stations in all months except July when a trace was reported at Bulverde. Aransas Pass was deluged on September 6th by the torrential rains associated with Hurricane Gladys with 10.45 inches, the highest amount recorded in any day during 1955. Evadale reported 23 days with 1.00 inch or more of precipitation, the highest frequency for the year. Snowfall amounted to 1.5 inches over the State with January providing 0.8 inch. The greatest monthly fall was 9.0 inches during January at Mount Locke. In spite of the general deficiency of moisture, the individual months of January, February, May and June were the wettest since the late '40's or early '50's.

STORMS

High winds hit the San Antonio area with gusts up to 63 mph on March 20th with attendant damage near $100,000. Hail about the size of golf balls damaged more than 100 roofs and knocked out window panes at Edna on March 31st with damage estimated at $45,000 to property and $50,000 to crops. On the 5th of April a tornado accompanied by hail and high winds caused six injuries and $1,000,000 damage to Jones and Throckmorton Counties. On the same day a hailstorm did $500,000 damage to West, Aquilla and Hubbard. On the 6th a tornado killed one person, injured 44 and did $100,000 crop damage and $2,750,000 property damage in the Sherman-Bonham-Dodd City area. Seven homes were destroyed and 309 homes were damaged; 14 other buildings were destroyed and 54 others damaged, according to a Red Cross survey in Grayson County. Lightning struck a group of boys on a high school campus, killing four and injuring two at Kingsville on May 19th. Amarillo suffered $2,000,000 damage on June 19th when hail damaged 6000 dwellings and 1500 automobiles. Damage from severe storms continued through October in addition to those summarized above. For a complete record of Texas storms, further information may be obtained from Climatological Data National Summary.

FLOODS

Minor flooding was reported in February from heavy rains at Edna and Ganado on the 4th and 5th and at Liberty on the 3rd-7th. Liberty was flooded again between April 11th and 18th from excessive rains over the Trinity River Basin. Hurricane Gladys and subsequent squalls in the Gulf drainage system on September 6th and 7th caused flooding in the Alice, Falfurrias and Kingsville areas. Clarksville was the site of inundations on September 24th causing widespread damage. Flash flooding on the same day occurred on the uppermost portion of the Nueces River. Excessive rains caused considerable flooding in the Breckenridge, Graham and Olney areas on September 25th. Wichita Falls was flooded from backwater of the Wichita River, causing inundation of 150 blocks and evacuation of 500 families on October 4-5th.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas.

- No record.

+ Also later date (dates) or months.

* Amount included in following measurement.

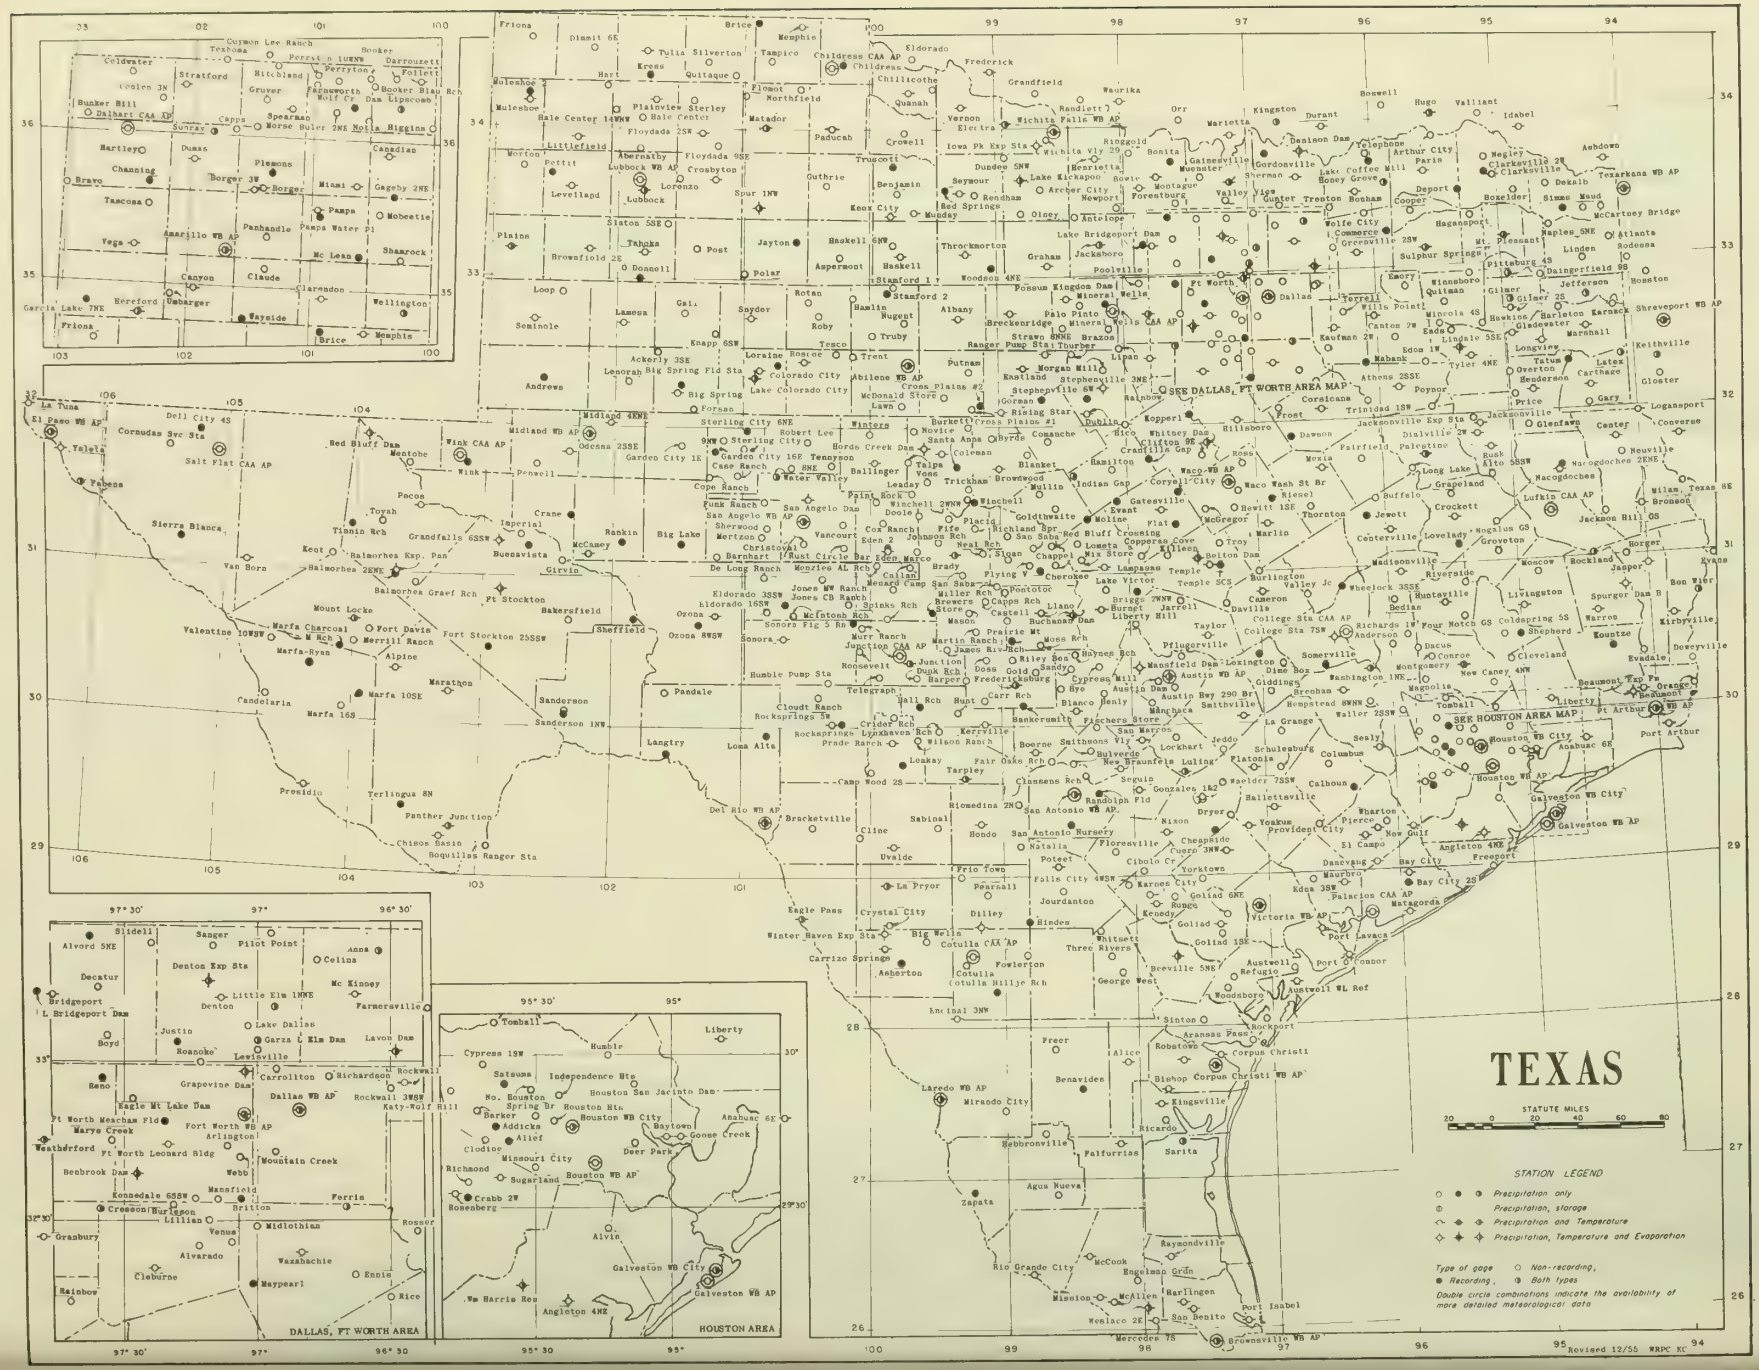
// Gage is equipped with a windshield.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

B Adjusted to full month.

E Amount is wholly or partially estimated.

M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing; see monthly Climatological Data for detailed daily record.



R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

T Trace, an amount too small to measure.

V Includes total for previous month.

Subscription Price: 20 cents per copy; monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

TEXAS

JANUARY 1956
Volume LXI No. 1

ASHEVILLE: 1956

TEXAS - JANUARY 1956

WEATHER SUMMARY

Mild temperatures prevailed on most days during January over western Texas. In other parts, temperatures varied but averaged near seasonal. Rainfall was comparatively light over most of the State. The Lower Valley was especially dry. Crops struggled through the dry weather but responded to the scant precipitation provided by the light snow and mists. Pastures provided little grazing and supplemental feeding of livestock continued in all areas.

Temperatures were mild but not unusually warm over western Texas throughout most of the month. Daily mean temperatures at El Paso were consistently above normal except on the 17th to 19th. On those days they were normal or slightly below normal. The Panhandle was warm during the first half of January, cool from the 15th to 25th, warm from the 26th to 28th, and cool the last three days. In eastern Texas warm weather prevailed during the first few days; the second and third weeks were cool; and warm weather predominated during the fourth week. Four well-developed cold fronts crossed the State during January. The first cold front pushed across Texas on the 6th. It brought the temperatures over the Panhandle to near seasonal and ended the mild weather over the eastern part of Texas. The second cold front on the 14th and 15th preceded the most severe weather of the month. The third cold front moved into the State on the 17th. By the 19th the freezing isotherm had been pushed southward into the Lower Valley and very near the coast. Most stations registered their coldest temperatures from the 13th to 19th. The coldest minimum for the State, 1 degree below zero, occurred at Spearman on the 18th. Southerly winds brought tropical air into the State on the 27th and 28th. Many stations had registered their highest monthly maximum temperatures during the first week. Others, especially over the extreme west and over the southern high plains, registered their highest temperatures on the 27th or 28th. Monthly maximums were mostly in the upper 70s and 80s. The highest, 92 degrees, occurred at Encinal and McCook. The last cold front of the month moved southward on the afternoon of the 28th and on the 29th. It brought cooler weather to the Panhandle and to eastern Texas. Monthly mean temperatures ranged from 33.1 degrees at Follett to 64.5 degrees at Port Isabel. Temperatures averaged mild over western Texas but near seasonal for the rest of the State.

No important rains occurred over Texas during the first half of January. Light freezing rain fell over the north, snow over the west, and drizzle and rain over the south on the 17th with some more generous falls locally on the 18th. More light drizzle to locally moderate rains occurred on the 21st and 22d. Glaze and light snow occurred over parts of the Panhandle on the 22d. Some stations received light to moderate rain or snow on the last two days of the month. Numerous stations on the High Plains and in the Lower Valley received no precipitation during January. Monthly totals were less than 1.00 inch at most stations over the Low Rolling Plains, Edwards Plateau, Trans-Pecos, and southern Texas. A few stations near the upper coast received several inches. The greatest monthly total, 7.34 inches, fell at Goose Creek. The greatest snowfall, 6.0 inches, occurred at several stations-Greenville, Mertzon, Paris, and Rockwall. A few stations along the coast and a number of scattered locations over the eastern part of Texas received more than usual January rainfall but by far the most stations received much less than in most Januarys.

Dryland small grain prospects faded during the first half of January. Irrigated wheat remained in fair to good condition. Small grain and winter pasture prospects over the eastern half of the State improved during the third week as the slow rain, sleet, and snow eased the drought. Light snow over the northwest merely extended the time which dryland wheat could survive. Wheat in a few localities where the snowfall was heavier improved temporarily but deteriorated during the last week of January, and many growers in the western Panhandle considered the crop a total loss. The crop held its own over the eastern High Plains and northern Low Rolling Plains. The moisture benefited established stands in Cross Timbers and adjacent Low Rolling Plains counties. Small grains and winter cover crops made good response to improved moisture and warm weather but even in those favored areas, subsoil moisture was generally short. Movement of commercial vegetables, especially cabbage, carrots, cauliflower, and spinach, from all winter irrigated areas was active. Light to locally heavy frosts were noted in parts of the Lower Valley. The hardy type vegetables escaped damage. Another cold wave moved into the commercial vegetable areas at the middle of the third week. Frosts were general from Falfurrias to Eagle Pass but were scattered and light in the Lower Valley. At the end of January, weather conditions were favorable over all the commercial vegetable areas. Early planted spring vegetables, especially cantaloupes, sweet corn, tomatoes, and watermelons, in the irrigated areas were up and making good growth. The lack of dry range pastures forced widespread supplemental feeding of all classes of livestock over the entire State. Some were showing considerable shrinkage and marketing of both cattle and sheep expanded sharply. The rains over the eastern half of the State during the last half of January greened up the native pastures, clovers, and oats and were expected to furnish grazing soon. The improved feed prospects in that area slowed the movement of cattle and sheep to market.

STORMS

The cold front which moved into Texas on the 17th dumped snow on northern Texas as far south as College Station. South of the snow was a belt of sleet and freezing drizzle. A three-quarter-inch coat of ice broke tree limbs and communication lines in the Burnet vicinity which was isolated for about twelve hours. Many schools dismissed early because of icy roads and bridges. Automobile accidents on the ice resulted in the death of four persons.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS

FEBRUARY 1956
Volume LXI No. 2

ILLINOIS

ASHEVILLE: 1956

TEXAS - FEBRUARY 1956

WEATHER SUMMARY

February was mostly warm and wet over eastern Texas, and chilly and dry over western Texas. February precipitation boosted wheat prospects. The heavy rains over the eastern third of the State and the warm temperatures in late February improved the spring range and pasture feed prospects, and cattle and calves were picking up the increasing supply of green feed in those areas.

A cold wave moved into Texas on the 1st bringing snow, sleet, and freezing rain to much of the State. The heavy snow was confined to the High Plains south of the Canadian River. The snow reached 30 inches in depth at Plainview on the 5th. Many stations in northeastern Texas received from one to several inches of rain during the first few days of the month. Freezing temperatures did not reach the Lower Valley. The cold weather persisted until the 12th. Light snows fell over the Plains and light rains over the east and southeast part of Texas during the second week--mostly on the 9th and 10th. A wedge of Canadian air pushed southward into central Texas on the 14th and 15th setting off a few thunderstorms and tornadoes in some northern, eastern, and upper coastal counties on the 16th and 17th. Dust storms swept across parts of the Plains on the 17th and a haze of dust spread across most of the State. Warm air covered the southern part of the State on the 18th and 19th. Light rains fell on the Upper Coast and Lower Valley on the 22d and 23d. A series of dry northers swept into northwestern Texas beginning about noon on the 23d. Gusts reached 90 miles per hour in west Texas. Amarillo reported the "fastest mile" to be 70 miles per hour on the 24th. Wind blown dust brushed across the State from the 23d to 25th. A mixture of dust and drizzle fell at Brownsville. No important rains fell over Texas during the last few days of February.

Monthly mean temperatures ranged from 31.3° at Stratford to 65.9° at Port Isabel and San Benito. In general, temperatures averaged relatively warm over most of eastern Texas. Monthly mean temperatures at Galveston, Port Arthur, and San Antonio were 1.7°, 2.7°, and 2.0° above normal, respectively. Temperatures averaged comparatively cool over the Panhandle and western Texas. Monthly mean temperatures at Amarillo, El Paso, and Lubbock were 4.3°, 4.2°, and 4.6° below normal, respectively. Monthly maximum temperatures ranged from 71° at Mt. Locke on the 22d to 95° at Cotulla and Laredo on the 17th. Most western stations registered their highest maximums on the 23d, or 24th. The highest maximums over the eastern areas came on the 14th to 18th or from the 26th to 28th. Monthly minimum temperatures ranged from 36° at Port Isabel on the 3d to -2° at Mt. Locke on the same day. Almost all stations registered their coldest temperatures for the month during the first week of February.

February rainfall totals exceeded 5.00 inches at most stations in East Texas. Lesser totals occurred westward and southward. Few stations in the western half of the State received more than 1.00 inch of precipitation except in the parts of the Panhandle which received heavy snows. Boxelder received 7.62 inches of rain during February. This was more than the amount received by any other station. Several stations, most of which are in the Trans-Pecos or the Edwards Plateau, received no precipitation during the entire month. Precipitation over East Texas and over the heavy snowfall areas of the Panhandle exceeded the usual February amounts. Elsewhere, rainfall totals were generally less than the long-term means. Several inches of snow fell over the extreme western part of Texas and over most of the Panhandle. Several stations received more than 20.0 inches of snow. The greatest snowfall, 61.0 inches, occurred at Vega. The heavy snow, sleet, and freezing rains during the first few days of February brought farm work, except the care of livestock, to an abrupt halt. In contrast, about the time the blizzard whistled into the Panhandle, the growers in the Lower Valley were starting to plant cotton. The snow and rain boosted the wheat prospects over the High Plains south of the Canadian River where rains had been urgently needed. Precipitation over the Low Rolling Plains provided temporary relief but more moisture was needed. Heavier freezing rain, sleet, and snow from the Low Rolling Plains eastward across the State provided moisture for starting small grains, winter grass and clovers when the temperatures warmed. Damp cool weather in early February kept workers out of the fields in the Coastal Bend and the Lower Valley. All livestock suffered from the low temperatures, wind, rain, sleet and snow but heavy supplemental feeding kept losses to a minimum. The snow and rain improved the grazing prospects from small grains, rescue grass, and clovers over the eastern third of the State. Prospects shaded out to the west and there were practically no prospects for range and pasture feed over much of the Plains, western Texas, Trans-Pecos, and south Texas below San Antonio unless soaking rains should fall later. Settling dust reduced the palatability of the short dry grass in the west and northwest.

After the temperatures moderated and the soil dried, field work gained momentum over the eastern half of the State. Cotton and sorghum planting became active in the Lower Valley. Wheat in the northwest responded to the improved moisture and the warmer temperatures but took a terrific beating from the dust and sand driven by winds,which, even by Plains country standards, were "very strong." Many Plains farmers chiseled their fields to prevent erosion. At the end of February, wheat prospects over the High Plains south of the Canadian River remained good due to the generous snow over the area. North of the Canadian, and over the Low Rolling Plains, precipitation had been light and more rains were urgently needed. Cattle and calves in the eastern and southeastern parts of Texas gained weight on the increased supply of green feed. In the west, northwest, and southwest, cattle were kept in fair to good condition by heavy supplemental feeding. Ewes wintered in fair to good condition on substantial supplemental rations.

Lucius W. Dye

STORMS

On February 1 a blizzard moved into the Texas Panhandle, disrupting all modes of transportation. Snow and wind continued through most of Sunday, February 5. Drifts blocked highways and streets. As the storm moved southeastward the snow changed to freezing rain and drizzle in Central Texas. Ice-loaded wires broke, disrupting communications in several communities. Highways iced as far south as Austin and San Antonio. El Paso received 8.1 inches of snow. Travelers stranded in cars and busses on the high plains were rescued by National Guardsmen and train crews. Twenty deaths were attributed to the five-day blizzard. Snow removal operations were still in progress on February 14 on the High Plains.

February 8 Tornado: A funnel was reported to have dipped down in Angleton, Brazoria County, at 11 a.m; shingles and tar paper were blown from roofs; plate glass windows were broken and telephone wires were torn down; damage was estimated at $500.

February 14 Tornado: A small tornado dipped into Nederland, Jefferson County, and Port Neches, about 12:30 p.m., moved northeastward over the City of Orange and dipped down into the Louisiana marshlands. Funnel destroyed a barn and garage and moved a house off its foundation at Nederland. Flying roofing knocked out four utility circuits at Port Neches. No personal injuries were reported; damages, however, were estimated at $25,000. Observers at Nederland and Port Neches did not sight a funnel. The storm was accompanied by excessive rain which dumped an estimated 3 to 4 inches in an hour. W. J. Robinson and Earl F. Riggs, both of Orange, reported watching a funnel-shaped cloud over the city. Mr. Robinson followed the cloud in his car to the Sabine River Bridge on U. S. Highway 90 and watched the funnel plunge through the Louisiana marshes.

At about 2:30 a.m. on February 15 a windstorm lifted the roof of a barn two miles southeast of Sulphur Springs. The roof was hurled into a power pole which broke and disrupted service in Sulphur Springs. In Crush the wind whipped power lines together and knocked out electrical circuits.

WEATHER SUMMARY (Continued)

On February 16 heavy hailstorms accompanied by strong straight line winds damaged buildings in Texarkana. Hail was reported over Waxahachie and Lake Whitney. On the 17th high winds across Central and North Texas demolished a home near Blum, tore down power and telephone lines in a belt from Gustine in Comanche County to Texarkana in northeast Texas. Heavy rains and high wind accompanied by hail broke plate glass windows in Arlington, blew down wires at Dallas, uprooted trees and destroyed plate glass windows at Lancaster, and blew four roofs off homes in Grand Prairie. Gusts of 69 miles per hour were reported in Dallas, and damage is estimated at $50,000.

February 24-25: An intense low pressure system centered over the Oklahoma Panhandle moved in an easterly direction, and caused dust storms and strong winds in Texas extending as far south as El Paso. El Paso reported gusts of 78 miles per hour; Amarillo had gusts of 88 miles per hour; and visibility at Amarillo was reduced to 1/8 mile because of blowing dust. As the high winds and dust moved across the State, signs and awnings were blown away; plate glass was broken; and automobiles were sand blasted. Several Perrin Air Force Base jets, parked for the night, were weathercocked by the wind force. An F-84 landing at Biggs Air Force Base near El Paso was blown and skidded off the runway in the heavy dust storm. It burst into flames and was destroyed.

R. D. Blood

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 1' NNW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either missing or received too late to be included in this issue.

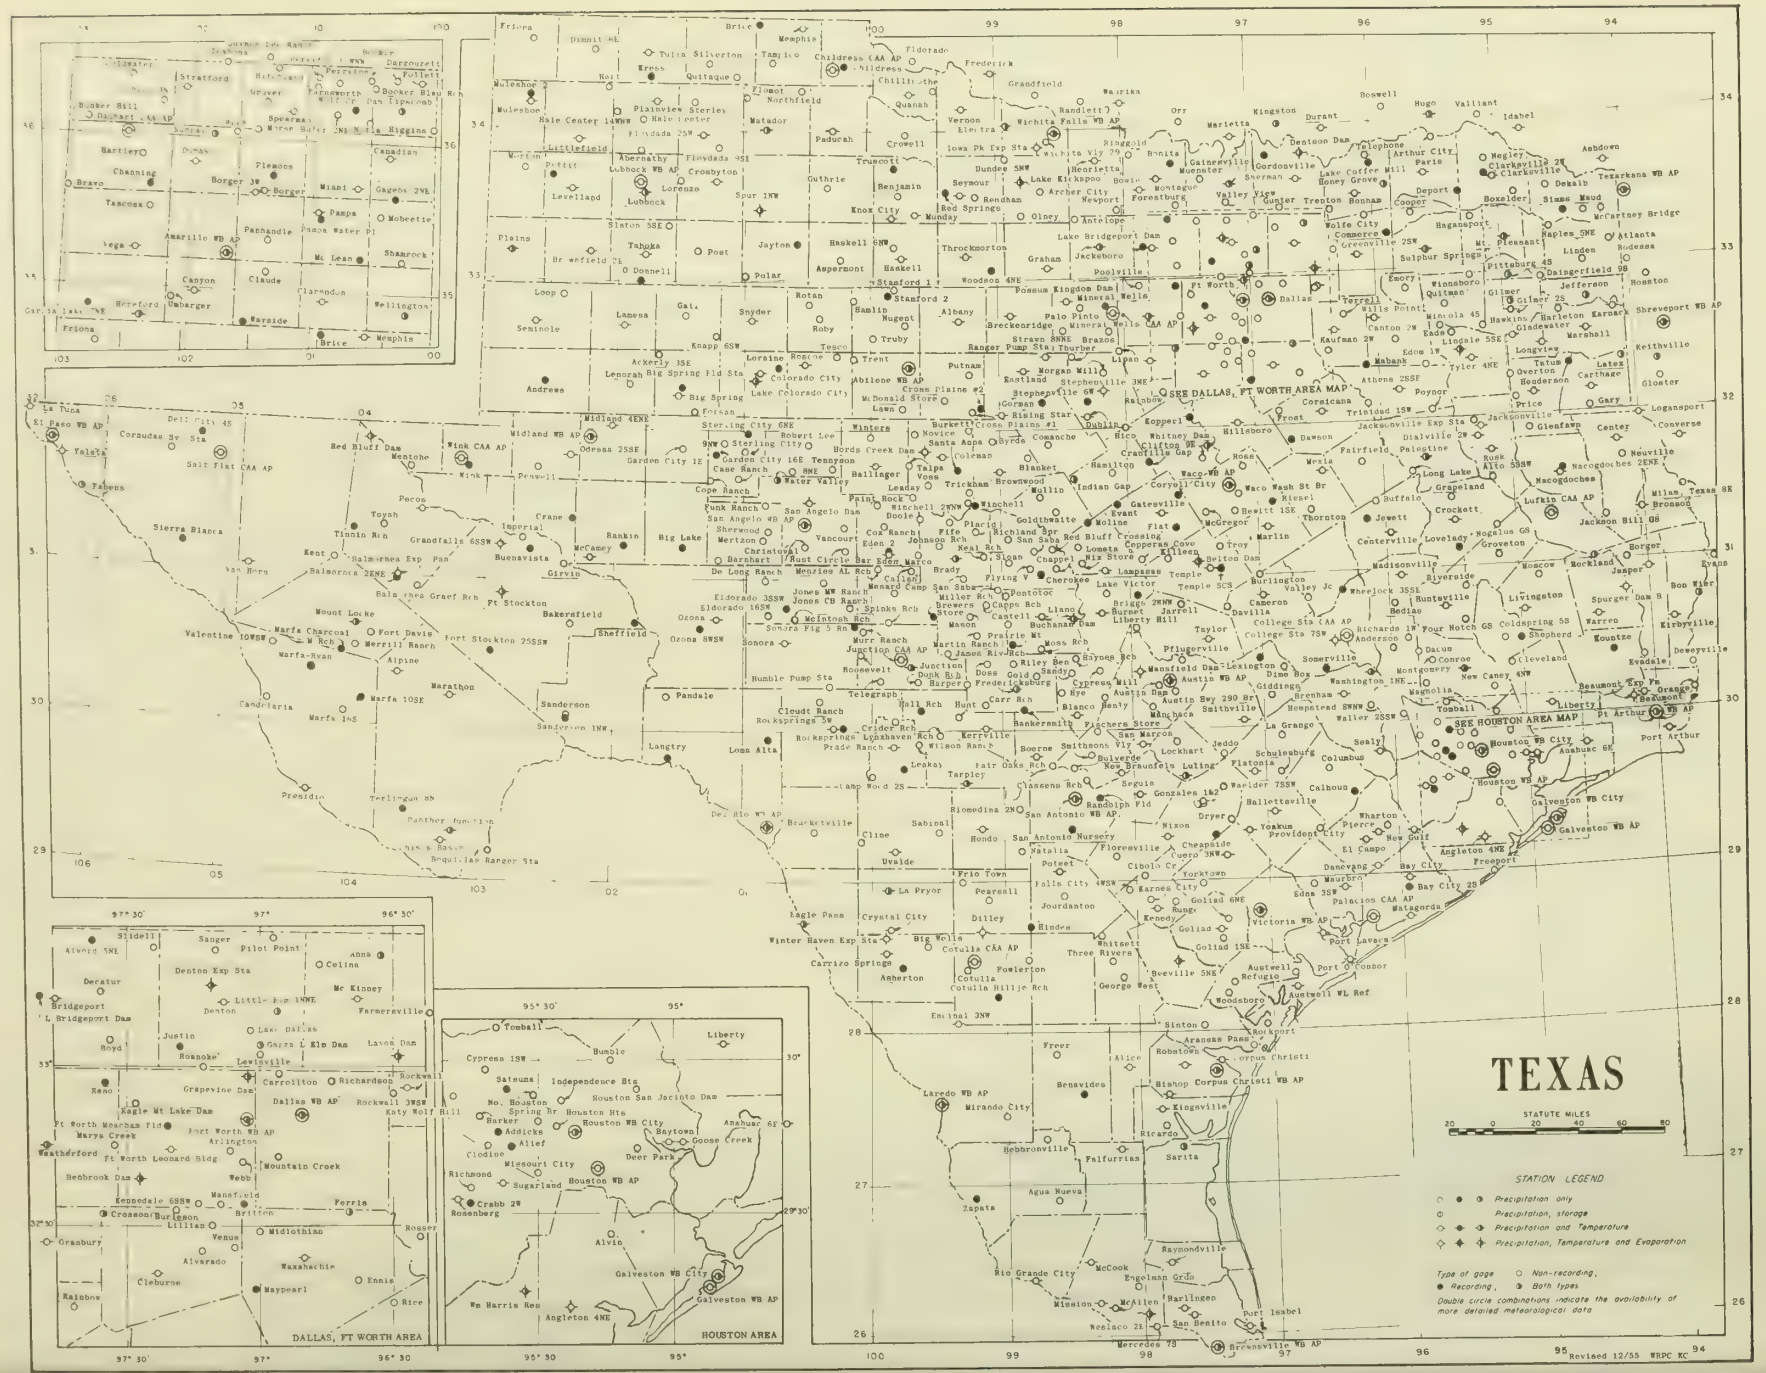
Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.



Long term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
e	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building. Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

MAY [illegible] 1956
UNIVERSITY OF ILLINOIS

ASHEVILLE: 1956

TEXAS - MARCH 1956

WEATHER SUMMARY

Most March days were warm and rainless. Spring range and pasture feed prospects continued on the down grade and substantial rains were urgently needed in most small grain producing areas. Drought conditions persisted in some non-irrigated vegetable growing areas.

The first few days of March were quite mild. A dusty, gusty norther moved across the State on the 6th and 7th dropping temperatures to the freezing mark except in the Coastal Bend and Lower Valley. Warm air pushed into Texas from the south on the 10th but was forced aloft by a blast of Arctic air which pushed in from the north on the 11th. The freezing isotherm was again pushed far southward. Most stations registered their lowest temperatures for the month soon after the passage of one of these northers. Monthly minimums ranged from 45° at Port Isabel on the 13th to 6° at Follett on the 12th. The warm weather returned to the western parts of the State on the 18th and to east on the 23d. The rest of the month was mostly warm. A few stations registered their warmest temperatures during the first few days of the month but most stations registered their highest maximums near the end of March. Monthly maximum temperatures ranged from 76° at Mount Locke on the 30th to 101° at Laredo and Rio Grande City on the 6th. Monthly mean temperatures ranged from 44.4° at Stratford to 70.2° at Laredo. Monthly mean temperatures were cooler than the long-term means at most stations over the eastern fourth of Texas but were warmer than the long-term means over most other parts of Texas.

Eastern Texas received light to substantial scattered rain showers daily from the 12th to 15th and some light showers from the 20th to 22d. Little rain of importance fell on other dates or in other parts of Texas. In general, March 1956 was among the driest of record. Few stations in the western half of the State received more than one-tenth inch of rain during the entire month. Most counties in East Texas, along the Upper Coast, and the Coastal Bend received more than an inch. Several stations received more than three inches. The greatest amount, 4.64 inches, fell at Four Notch Guard Station. A few widely scattered stations in the east received more than their long-term means for March. Most stations over the western three-fourths of Texas received less than one-tenth of their long-term means.

In general, March weather was unfavorable for agriculture, The almost statewide lack of rain during the month slowed planting of spring crops. A hard freeze penetrated deep into southern counties and brought light fronts into the Lower Valley on the 8th. Freezing temperatures again penetrated central Texas on the 12th and 13th. These freezes and frosts seriously damaged the peach and plum crops throughout the central third of the State. Damage was moderate over East Texas and a fair crops was in prospect. Strong north winds accompanying the freezes damaged young crops. Pecans escaped freeze damage. Several cold fronts kicked up dust storms in the northwest and dust frequently drifted over the rest of the State. The cold weather spells were separated by days with very high temperatures.

Most land had been prepared for planting but growers waited for rain and warm weather to avoid risking seed. Some corn was up as far north as the Red River but much acreage needed moisture to germinate the seed. Warmer weather during the last week of March benefitted the cotton in the Lower Valley. Dry conditions delayed the planting of peanuts in South Texas. Pastures deteriorated and supplemental feeding continued in the droughty western side of the State. Green feed was generally available in the eastern part of Texas where the rains had been somewhat more generous.

Lucius W. Dye

STORMS

On March 21 a pre-cold frontal squall line formed between San Antonio and Austin, through Kerrville and Laredo early in the afternoon, moving southeastward. The squall line triggered tornadoes in Central Texas and down through the Coastal Plain. Funnels were observed near Troy, Flat, Alice, and George West. Violent thunderstorms and high winds were associated with the squall line as it moved through the Lower Rio Grande Valley. Severe hailstorms wiped out crops and smashed windows in the Rio Hondo area. Up to 5 inches of rain and winds up to 75 miles per hour occurred in the Lower Valley. Heavy rain and hail the size of marbles were reported eight miles northwest of Beaumont. Estimated total damage in real property, $57,500.00; eastimated total crop damage, $400,000.00.

Richard D. Blood

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables; but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

ASHEVILLE: 1956

TEXAS - APRIL 1956

WEATHER SUMMARY

Temperatures averaged near seasonal. Critical drought continued to dominate farm activity over much of the State. Rains over the coastal area on the 23d and over a band from Menard to northeastern Texas on the 30th improved the corn, cotton, pastures, and sorghum in those areas.

The first two days of April were very mild. A cold front on the afternoon of the 2d brought cool weather to western Texas and dropped the temperatures over eastern Texas to near seasonal. The wind at Lubbock reached 64 miles per hour. Heavy dust storms from western Texas swept through the State. A low pressure area moved across the Panhandle on the 8th and high winds--57 miles per hour at Amarillo--gave the area the worst dust storm of the season. The storm spread to the rest of the State on the 9th. This storm also brought the lowest temperatures for the month. Most stations registered their lowest minimums on the 9th, 10th, or 11th. Monthly minimums ranged from 20 degrees at Dumas on the 9th and at Follett on the 10th to 58 degrees at San Benito on the 10th and 11th. Northwest winds brought more dust storms on the 14th and 15th. Moderate daytime temperatures and cool nights continued to the end of the third week as a succession of cool air masses moved across the State. Tropical Gulf air warmed much of the State at the beginning of the last week but the weather turned cooler over the north at the end of April. Many stations in the central and southern parts of Texas registered their highest maximums on the 6th, 7th, 14th, or 15th. Most stations in eastern and western Texas and in the Panhandle registered their highest temperatures during the last week. Monthly maximums ranged from the 80s over most of eastern Texas to 104 degrees registered at Rio Grande City on the 2d. Monthly mean temperatures ranged from 52.7 degrees at Dumas and Follett to 75.8 degrees at Rio Grande City. Monthly mean temperatures were warmer than the long-term means at most stations over central Texas but were cooler than the long-term means over eastern and western Texas.

Light scattered showers occurred on several days of April. Severe thunderstorms and tornadoes dumped heavy rain and hail over northeast Texas on the 5th. Thunderstorms formed over the eastern third of the State on the 9th and dropped generous showers in the Coastal Bend area. Light scattered showers occurred daily from the 18th to 22d. Very heavy showers fell along the coast on the 23d. Port Isabel received 7.45 inches on the 23d. Corpus Christi Airport received 7.19 inches and the other station at Corpus Christi received 8.28 inches during the storm. A band of significant precipitation on the 29th and 30th extended from Menard to the northeastern corner of the State. In general, stations along the Gulf and some north central and northeast areas received over two inches of rain during April, but much of western Texas received less than one inch. Many stations received no rain or only a few sprinkles. Some eastern and Gulf stations received more than four inches and a few stations received more than eight inches. The greatest monthly total, 9.20 inches, fell at Corpus Christi. Monthly totals exceeded the long-term means over parts of the Lower Valley, at a few stations along the Gulf, and a few other widely scattered stations. Large portions of the State received less than half the long-term means and many western stations received only a small percentage of their long-term means.

The hit-and-miss shower pattern temporarily changed the gloomy agricultural outlook in local areas but over most of the State the farmers were still hoping for rains to save small grains, germinate corn and cotton, start crops, and bring on pasture feed. The heavy rains from Corpus Christi southward eased the drought in that area and the rains over a band from Abilene eastward across the northern part of the State provided temporary relief. Scattered light showers and cool weather slowed deterioration of wheat in the northwest but abandonment was heavy and the prospects of a crop continued to diminish. Irrigated wheat was fair to good. Commercial vegetables made satisfactory progress in irrigated areas and along the coast but progressed slowly in the other dryland areas. Range and pasture feed continued on the downgrade over much of the State. Rescue grass and clovers were short and maturing early on the eastern side of the State. On the west, feed reserves were about used up and drought emergency feed was being imported. Yearling and spring lambs continued to move in fair volume and big steers from south Texas were beginning to move to Osage and Flint Hill pastures.

STORMS

Dust storms accompanying a cold front moved across Texas on the 2d and 3d. Three persons were killed, 10 were injured, and property damage amounted to $10,000. Winds reached 80 miles per hour. The main force of the storm centered in the Permian Basin. In some places, street lights were necessary during the middle of the afternoon of the 2d. At Odessa the dust reduced the visibility to half a block and the wind broke several plate glass windows in downtown stores, damaged roofs of homes, and twisted television antennas. Visibility in El Paso ranged from zero to 100 feet. The winds reached 80 miles per hour at Marfa and Alpine. Power and communication were disrupted for 45 minutes at Big Spring, and small buildings were demolished at Aspermont and Snyder. Airplanes were grounded in most west Texas cities and busses were hours behind schedule. At least three persons were killed in traffic crashes in the blinding dust. The southerly winds which preceded the front burned some cotton in the Valley and covered small plants with dirt. A quarter million acres that had not blown previously suffered moderate to severe soil erosion.

On the 5th a tornado struck the Bryan vicinity, Brazos County, leaving $250,000 property damage. Three other funnels were sighted but none were seen to touch the ground.

Another severe dust storm in the Panhandle on the afternoon of the 8th spread over most of the State on the 9th. Visibilities were reduced to one-eighth mile over wide areas. Winds reached 78 miles per hour over central Texas. Snow flurries occurred at Amarillo as temperatures dropped to 33 degrees. Light showers at Dallas and Waco along with the dust resulted in a sprinkle of muddy water.

On the 9th a squall line developed ahead of the cold front as it moved into the Gulf area. The squall line started thunderstorms from Port Arthur to Brownsville and produced locally heavy showers. The gusty winds at Taft blew several automobiles off the highway during a heavy shower. The storm eroded 95,000 acres of land that had not blown before during the year.

On the afternoon of the 14th, a line of tornadoes caused $500,000 damage in Tarrant, Ellis, Rockwall, and Montague Counties. One person was injured and another was killed.

On the 23d a local flash flood caused $2,500 damage to crops and $12,500 damage to other property. One person was injured and another killed as the result of this storm.

Hail associated with a frontal thunderstorm damaged automobiles, neon signs, and roofs in the Wichita Falls area to the extent of $10,000 on the 28th.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables; but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

TEXAS - MAY 1956

WEATHER SUMMARY

May was a hot month. Precipitation was very unevenly distributed over the State. Spring crops progressed nicely in the localities that were favored by adequate showers but suffered where the sprinkles were too light to be effective.

Warmer-than-seasonal temperatures prevailed on most days during May. Several "cold fronts" moved into the Panhandle and west Texas during the month and brought cooler temperatures but their effects were very temporary. Southerly winds soon erased the effects of the fronts and the temperatures changed to warmer. Although hot weather prevailed on most days, different parts of the State registered their highest temperatures on different dates. The 6th and 7th were the hottest days over the southern High Plains. The hottest days over west Texas and the Panhandle were the 9th to 13th. East Texas registered the highest temperatures during the period 18th to 20th, and along the southern coast the last few days of the month were the warmest. Monthly maximums ranged, in general, from the high 80s along the southern Coast to near or slightly above 100 degrees along the Rio Grande above Rio Grande City, over the Trans-Pecos, and over the northern Low Rolling Plains. The highest temperature for the State, 111 degrees, occurred at Presidio on the 12th. Most stations registered their lowest temperatures during the first few days or on the 11th, 15th, or 16th. Monthly minimum temperatures ranged, in general, from near 40 degrees over the Panhandle to the lower 60s along the Lower Coast. The lowest temperature for the State, 39 degrees, occurred at Ysleta on the 11th and at Stratford and Vega on the 15th. Monthly mean temperatures ranged from 67.3 degrees at Stratford to 84.2 degrees at Presidio. Monthly mean temperatures were above the long-term means at almost all stations. In general, the greatest positive departures were over the northern and western parts of the State. Temperature departures ranged from -1.7 degrees at Mission to +6.7 degrees at Albany and Presidio.

A cool front along a line from Fort Worth, Austin, and Laredo set off some locally heavy thundershowers on the 1st. Several stations received more than seven inches of rain on the 1st. Dublin received 8.71 inches and Stephenville 3 NE received 9.71 inches on that date. The showers continued on the 2d from the Lower Valley to the northeastern border of the State. A few piddling showers fell over the Panhandle, and the Trans-Pecos remained dry. The rest of the first two weeks of May was mostly hot, dry, and windy. Dust blew over the High Plains, the Low Rolling Plains, and parts of the Trans-Pecos during most of the second week. Scattered light rains fell over the southeastern half of the State on the 15th. A few locally heavy showers occurred over the south on the 15th with a few stations receiving more than two inches on that date. The skies cleared on the 16th and fair weather persisted to the end of the third week. Warm moist air blanketed the State from the 22d to the end of the month. Moderate to heavy thundershowers fell on most days and tornadoes skipped across the High Plains and the Low Rolling Plains on several days. Several stations received no rain during the entire month. The greatest monthly total, 11.33 inches, fell at Stephenville. In general, the Trans-Pecos, the western edge of the Edwards Plateau, and the southern High Plains received the least rain--from none to two inches. The Blacklands and parts of East Texas received the most--more than four inches. In general, the southern Cross Timbers and the southern Blacklands received precipitation in excess of the long-term means. Elsewhere, most stations received considerably less than the long-term means.

Soaking rains on the 1st gave new life to crops and pastures. Torrential rains in the southern Cross Timbers caused some local flooding but the benefits to crops and pastures far exceeded the flood damage. The rains renewed the hopes of the farmers who readied their tractors, planters, and cultivators so they could get into the fields as soon as the ground dried sufficiently. After the fields dried, the tractors rolled from early to late to rush planting, replanting, and cultivating and to overcome the early season delays that had been caused by lack of moisture. Crops continued to suffer in the areas missed by the rains. Field work continued active as summer temperatures stimulated plant growth. The rains were very beneficial to the wheat in the northern Low Rolling Plains and the north Texas counties. Combining started in the Seymour-Benjamin-Crowell area about the middle of May and by the end of the month a large part of the Low Rolling Plains crop was in the bin. The combines were ready to start rolling in the southern High Plains counties. Corn made good development in north Texas but in central, southeastern, and east Texas it had reached the tasseling stage and needed more rains to prevent deterioration. In some south central counties, farmers were salvaging poor corn for silage and forage. Cotton was in generally good condition at the end of May. Rice prospects were favorable. Peach prospects improved and Texas citrus was above average in condition. The harvest of most early spring vegetables was almost complete. Tomatoes continued to move in the Lower Valley. Irrigated vegetables in the Panhandle for early summer harvest were in good condition despite hail losses in scattered areas. Range and pasture feed was still short in the northwest but was coming along fast and supplemental feeding was tapering off. Grass was also responding to improved moisture conditions in the northern Blacklands and in spots of east Texas. In parts of the State where the rain missed, supplemental feeding was starting again and many cattle and calves, many in poor flesh, were being marketed in heavy volume.

Lucius W. Dye

STORMS AND FLOODS

Storm of April 30 to May 2: A stationary front combined with a series of squall lines caused severe thunderstorms, heavy rains, hail, and isolated tornadoes the last day of April and the first two days of May in Texas. The showers and thunderstorms occurred along a line extending from south of Fort Stockton through Dallas and northeastward to the Red River. Serious headwater flooding occurred in the Brazos and Colorado watersheds. Elm Creek near Ballinger reached the highest stage in 24 years of record. On Pecan Bayou, Brownwood reservoir reached a maximum level on May 2--6.4 feet above spillway crest.

Most of the flooding was confined to the area bounded by Dublin, Stephenville, and Hico, Texas. The Soil Conservation Service determined that the weighted rainfall for this watershed was 9.49 inches. Maximum rainfall in the basin was 14.54 inches measured by a standard type gage. Most extensive flooding occurred in the Pecan Bayou watershed in and below Brownwood. About 200 homes were abandoned temporarily on May 2 in Brownwood, about 50 of which were not usable for two or three days.

The Brazos River, just below Waco at the junction of Tehuacana Creek, crested near 26 feet. Considerable flooding occurred in this creek basin. About 30 bridges were washed out and 22,000 acres of crops flooded. About 80,000 acres of crop land will require replanting because of erosion and rain damage. About 100 miles of fences were destroyed in this area.

On April 30 Stephenville in Erath County caught three inches of rain within 45 minutes. Eight inches of rain was reported to have fallen in two and one-half hours. All highways were inundated and closed.

Valera, Coleman County, reported 7.50 inches on May 1. About 75 persons were rescued by boats. At Brownwood trains required rerouting. At Thrifty, about 12 miles northwest of Brownwood, rain gages overflowed, three homes were flooded with water, and mud was reported 18 inches deep. Gas lines broke and phone lines were down.

Heavy rains south of Fort Stockton caused flash flooding in Pecos and Terrell Counties between Fort Stockton and Sanderson. The water swept over bridges in the Big Canyon watershed. Numerous thunderstorms accompanied by gusty winds, hail, and lightning caused damage in the area of frontal activity on May 1. Lightning struck two homes in Dallas, causing flash fires. Lightning struck two homes in Tyler between 3:50 and 4:00 p.m., causing minor damages.

Gusty winds blew three telephone and telegraph poles down four miles east of U. S. Highway 67 southwest of Fort Stockton.

Lightning continued through the night and at 6:00 a.m. on May 2 a bolt electrocuted eight cows at Texas Tech in Lubbock.

Tornadoes were reportedly sighted near Belton, McGregor, Lampasas, Hamilton, Valley Mills, Gatesville, and Rumley. A barn and house were demolished at Rumley. An outbuilding was destroyed southwest of Gatesville.

On May 2 from 1:03 a.m. to 1:15 a.m., an unusually severe thunderstorm associated with a squall line moving from northwest to southeast passed over Galveston Island. The fastest mile of wind recorded was 55 miles per hour from the west at 1:06 a.m. A peak gust of 106 miles per hour from the northwest was recorded at 1:08 a.m. Another gust of 102 miles per hour was recorded about five minutes later. At the Airport Station the highest observed gust was 77 miles per hour at about 1:10 a.m. The thunderstorm apparently intensified as it reached Galveston Island. On the mainland side of the bay at Texas City, Texas, gusts of 43 miles per hour, 61 miles per hour, and 65 miles per hour were recorded at three different points in the industrial area and a gust of 65 miles per hour was observed at the drawbridge on the causeway in the middle of Galveston Bay. A rapid rise of 0.9 foot was recorded in the water level of Galveston Channel during the storm. Damage was spotty and was estimated at $20,000. On the water front, several warehouses were damaged and a large Gentry Crane weighing some 450,000 pounds was toppled into the slip at Pier 14. Several plate glass windows in the city were broken, roofs damaged, and antennas, sign boards, some power lines, and a few large trees were blown down. Some damage to roofs, television antennas, and shrubbery was reported from the mainland.

Storm of May 7: A squall line set off several tornadoes and severe thunderstorms in West Texas in an area bounded by Lubbock, Andrews, Midland, and Aspermont.

A tornado damaged three houses in Andrews. Two others were sighted in the vicinity. Lightning struck a radio tower at Lamesa, where winds put about 600 telephone lines out of order. Gusty winds also damaged farm buildings near Brownfield about 50 miles southwest of Lubbock. Lubbock streets were flooded by a 45-minute downpour.

High winds accompanied by lightning damaged roofs and television antennas in Paducah. Wind knocked down a brick wall and high board fence. Lightning started a fire which destroyed a farmhouse.

At Aspermont a home was unroofed and a picture window was knocked out. Television antennas were twisted or broken off. Trees were uprooted. Most damage occurred in the southwestern part of the city.

Storm of May 14: Scattered thunderstorms with hail and high winds reached across West Texas from the lower Pecos Valley to the Red River. Locally heavy rains and hail occurred over small areas. Precipitation in the amount of 3.60 inches was reported 12 miles north of San Angelo. In Brown County precipitation ranged from a trace at Winchell on the Colorado River in the south to torrential downpours in the north; 3.25 inches was reported three miles north of Zephyr.

In Comanche County rains up to two inches were reported. Eight miles north of San Angelo on U. S. 87 a highway patrolman reported hailstones as big as baseballs.

Storm of May 23: Squall line thunderstorms with isolated tornadoes banded across the High Plains and northern Low Rolling Plains during the afternoon and evening. Two funnels were sighted at New Deal north of Lubbock but did not touch the ground. A third funnel touched ground 12 miles south of Vernon and overturned two garages and a water tank. Locally heavy showers across this area caused some minor flash flooding. Lightning damaged power transformers at Amarillo. At Adrian, 48 miles west of Amarillo, a hailstorm covered the ground to a depth of six or eight inches blocking Highway 66 at 8:00 p.m. Trucks finally cut ruts through the hail and traffic resumed.

Storm of May 25: Squall line with severe thunderstorms and isolated tornadoes caused flash floods in the Panhandle and South Plains. Cloudbursts and hail flooded a creek near Texline. Two farm families were evacuated by motorboat when creek level rose to windowsills of their houses. Airline pilot reported two funnels 40 miles ESE of Dalhart. South of Anton flood waters washed a car off the highway and occupants climbed on top of their car to escape.

Lightning struck a tree northeast of Levelland killing a woman who was standing nearby. About the same time a small tornado struck about 28 miles WNW of Lubbock uprooting trees and snapping power line poles. It damaged a farm in the area.

Storm of May 27: Tornadoes skipped over wide areas of North and West Texas but there were no injuries and only minor damage was reported. Funnels were reported to have touched the ground at Judd, Knox City, Jayton, and Rochester. Twenty-two were reported in the Abilene area but only damage resulted to farm buildings seven miles northwest of Stamford and four miles south of Rule.

Lightning struck a depot at Amherst and the ensuing fire destroyed it.

Hailstorms occurred in the area of thunderstorm activity but no serious damage was reported.

Storm of May 29: Tornadoes and gusty winds arched across the Panhandle and North Texas during the night. Two funnels were sighted in the Olton area but did not touch the ground. A tornado touched the ground three miles east of Kress and traveled toward Tulia. However, no damage was reported. Another tornado was reported near Whiteface moving northeastward but no damage or injuries were received. Gusty winds associated with thunderstorms blew plate glass windows in and unroofed buildings along the squall line's path. Heavy showers caused local flash flooding in many sections.

Storm of May 30-31: A squall line moving southward into the State on the 30th brought thunderstorms and high winds into North Texas. Heaviest rains and winds were concentrated in the Fort Worth-Dallas area, though activity extended westward across the State through the South Plains into eastern New Mexico. Winds disrupted telephone service in the Fort Worth area during the afternoon of the 30th. The sudden downpour of rain temporarily blocked underpasses in many cities.

As the squall line pushed southward on the 31st the high winds associated with it disrupted utility services in Waco, Austin, and other communities in Central Texas. Waco had gusts to 74 miles per hour, and Austin's peak gust was 61 miles per hour.

Richard D. W. Blood

[illegible] NOTES

The four digit identification numbers in the Index Number column of the Station Index are assigned in a state-wide [illegible] within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the point named.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 23 months will be carried in the June issue of this bulletin.

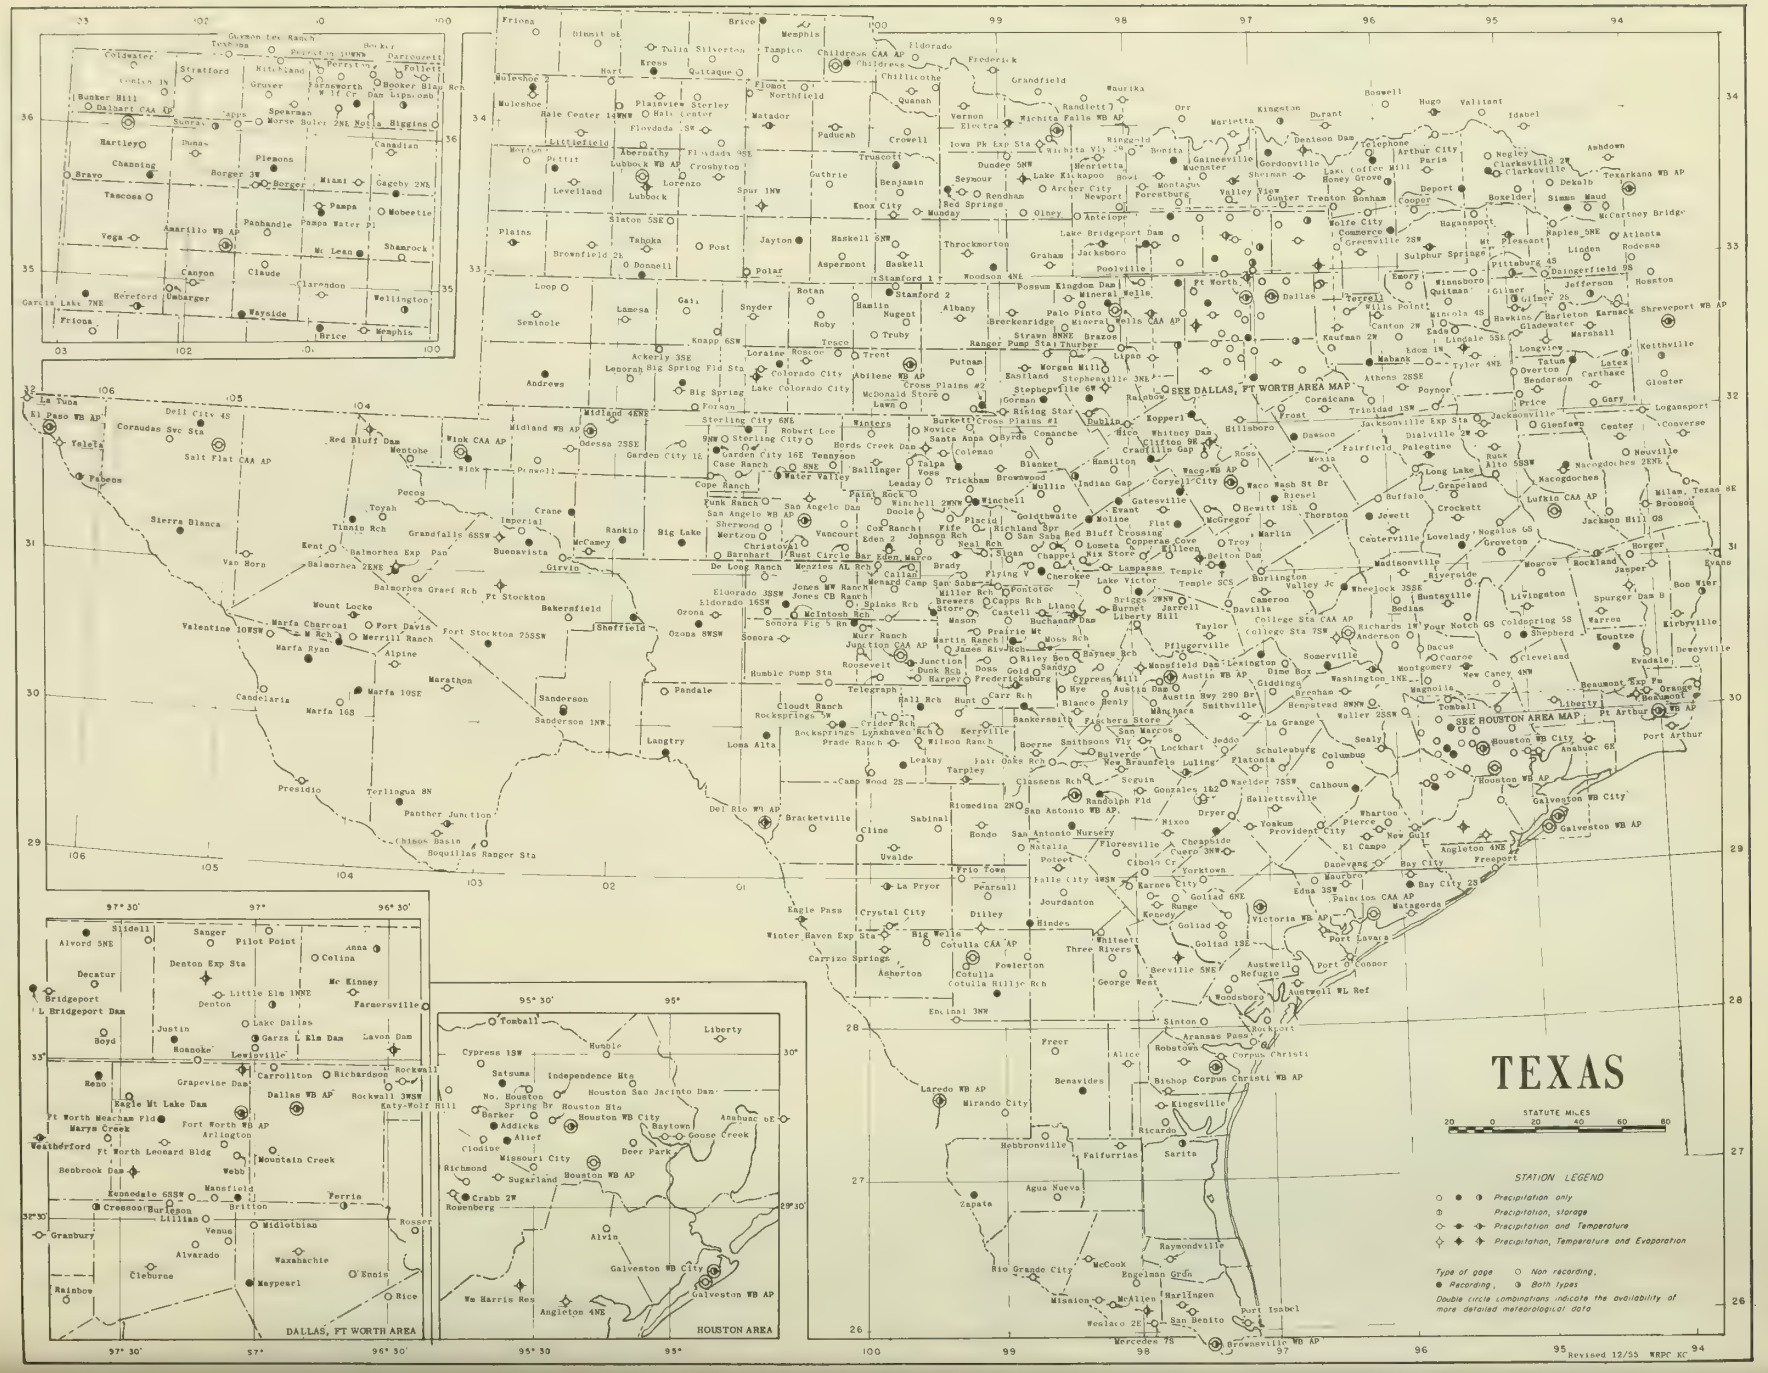
Stations appearing in the tables but for which data are not listed are either closed or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the Standard Weather Bureau type pan of 4 foot diameter unless otherwise [illegible]

Amounts in Table 3 are from non-recording gages unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation, [illegible] the Station Index for observation time.



Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For those stations snow on ground values are at 0830 EST. "AIR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Additional information regarding the climate of Texas may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas.

---	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building. Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

TEXAS

JUNE 1956
Volume LXI No. 6

ASHEVILLE: 1956

TEXAS - JUNE 1956

WEATHER SUMMARY

June was hot and dry. Droughty conditions spread and intensified, and crop prospects faded over a widening area with each passing day.

Hot weather prevailed over most of Texas on almost every day of June. Temperatures were above normal at Abilene on every day except the 9th when the daily mean temperature was exactly normal. At Amarillo, the daily mean temperature on the 1st was 1° below normal but the mean temperatures were above normal on all other dates. Daily mean temperatures exceeded the daily normals at Del Rio and San Antonio on all days except the 19th when the mean temperature was normal. Only two previous Junes have been hotter at San Antonio and only three have been hotter at El Paso. It was one of the hottest Junes of record at Del Rio. The weather at Brownsville did not conform to the general pattern over the rest of the State. At Brownsville, June 1956 was the wettest since 1950 and the coolest since 1913. Temperatures at Brownsville averaged below normal throughout the month except on the 14th, 15th, and 16th. Maximum temperatures reached 100° or higher except at a few stations in the Panhandle, at some high elevation stations in western Texas, at Boerne, along the Gulf, and over southeastern Texas. Monthly maximums ranged from 89° at Mt. Locke on the 3d and 16th to 113° at Presidio on the 15th. Maximums over most of the State were between 100° and 110°. Temperatures above 90° were frequent over most of the State and occurred every day at some stations. Minimum temperatures ranged from 49° at Bronson on the 2d to 73° at Laredo on the 3d, 9th, and 10th and at Corpus Christi on the 9th and 10th. Monthly minimums were in the upper 50's and lower 60's over most of the State. In south Texas, monthly minimums were mostly in the upper 60's. Monthly mean temperatures ranged from 72.3° at Mt. Locke to 90.1° at Presidio. Monthly mean temperatures were below the long term means at several stations in the extreme south and over many counties in southeastern Texas. Over the rest of the State, monthly temperatures were above the long-term means. The largest departures were, in general, over the Low Rolling Plains and in the northwestern part of the Panhandle. Temperature departures ranged from -2.7° at Anahuac to +6.2° at Stratford.

Light showers fell somewhere in the State on almost every day of the month. Amounts were generally light although several stations received generous showers on the 13th to 15th, 17th to 20th, and on the 28th. Precipitation over the State was very uneven. Several stations received no rain during the entire month and others sprinkles too light to measure. Many central counties received less than 0.10 inch and many others less than 0.25 inch. The famous Comal Springs at New Braunfels ran dry for the first time known. The average flow of the Guadalupe River above Comal River at New Braunfels reached an all-time low. Other streams in the Guadalupe River basin ran dry for the first time known or reached record lows. In general, the areas which received less than one inch included the Low Rolling Plains, the southern Cross Timbers, Edwards Plateau, portions of south central Texas, and most of the Trans-Pecos. The Rio Grande Valley (except the Lower Valley) also received less than one inch. Heavier rains fell over the Lower Valley, the west central and northeast portions of the Panhandle, and the extreme eastern part of the State. A few stations in east Texas and in the Lower Valley received more than four inches. The greatest monthly total, 6.43 inches, fell at Gary. Precipitation exceeded the long-term means for June at El Paso, over the west central portion of the Panhandle, at Brownsville and vicinity, and at a number of stations in southeastern Texas. Rainfall was more than twice the long-term means at Bay City and at Friona. Over most other parts of the State, rainfall was less than half the long-term means. Over parts of northeast Texas and most of central Texas, the monthly totals were less than one-fourth of the long-term means and over many central counties, precipitation was less than one-tenth of the 1931 to 1955 averages.

By June 1st crops were suffering from lack of moisture over a wide area. During June the area became larger and the drought became worse. Conditions were most critical over central and south central Texas but much of the Low Rolling Plains and adjacent parts of the Cross Timbers and Edwards Plateau were not far behind. In those areas, feed crops and pastures were a near failure. Time was running out for rain to help the corn, sorghums, and cotton. The need for rains was urgent to prevent one of the most severe droughts of record. By contrast, in the Coastal Bend and lower coastal country, an excellent sorghum grain crop was assured and cotton was fair to good. Prospects were good to excellent for rice in the southwest and for irrigated crops in the Lower Valley, Trans-Pecos, and High Plains areas.

Cattle and calves lost weight as dry range and feed supplies dwindled. Scorching temperatures forced the animals to hunt shade instead of the short sparse grass. Ewes and lambs were in generally poor to fair condition. Range feed in the main sheep country was practically eaten out and there were no prospects for additional feed until soaking rains were received.

Lucius W. Dye
Weather Records Processing Center
Kansas City, Missouri

STORMS

Unstable conditions prevailed over the State, bringing high winds, thunderstorms and hail to the Plains, Panhandle and north Texas as the drought continued over much of the State. Rainfall was local but heavy. Numerous lightning strikes occurred from Denison to Lamesa on the 3rd while a freak windstorm concentrated in a four-block area at Rule in Haskell County damaged a cotton oil mill, a compress roof and a cotton gin.

On the 4th lightning killed a farmer near Olton, struck a house, and burned up a pump motor in the town. Meanwhile hailstones cut a swath through fields. Width of the damaged area varied from one to two miles and extended from ten to fifteen miles.

On the 5th heavy hail northeast of Lockney destroyed 300 acres of cotton while high winds blew roofs off barns and carried roof tin 100 yards.

On the 7th heavy hail damaged cotton acreage northwest of Levelland and around Plainview. Lightning killed a farmer near Tulia. Another bolt caused a fire in an oil tank farm near Sunray, destroying 20,000 barrels of oil. A tornado funnel not touching the ground was reported northwest of Plainview. Another funnel was reported 15 miles northwest of Lockney, but did not touch the ground.

On the 8th hail cut a swath six by two miles wide through cropland southwest of Lockney, while lightning struck at Levelland destroying a 210-barrel oil tank. Lightning and gusty winds destroyed roofs and plate glass windows at Graford.

On the 9th high winds and lightning disrupted electric power at Jasper. While heavy hail swept through 40 square miles of cotton in western Lubbock County, winds up to 65 mph coupled with torrential showers flooded streets and covered roads with water in Lubbock. Power and telephone service was disrupted.

On the 11th high winds and lightning disrupted electric service at Jasper and burned out a generator. Lightning struck a man fishing on the Neches River 45 miles north of Silsbee. Lightning also struck a power pole near Beaumont disrupting service to the town of Silsbee for about 3 hours. Winds blew down a drive-in theater screen at Nome, about 20 miles west of Beaumont, and damaged roofs.

(Continued on Page 130)

WEATHER SUMMARY (Continued)

On June 15th strong winds and heavy rains caused damage along the Texas Gulf Coast. Hardest hit area was centered around Baytown where two private planes and a hangar were destroyed. Two other light planes were damaged. Only one wall of the hangar was left standing. The winds, part of a squall line, moved into Houston at about 3:20 a.m. and lasted about three hours. Highest speed recorded at Houston was 62 mph but Galveston airport recorded 79 mph. The winds blew down numerous garages and barns throughout Harris County. In Houston the wind snapped off tree branches, toppled trees, blew down advertising signs and knocked out traffic signals. Brief heavy rainfall which accompanied the wind flooded streets and underpasses.

On the 17th thunderstorms, heavy rains and scattered hail fell on the South Plains from Seminole north to Farwell and Amarillo and from the New Mexico line to beyond Motley County. A suspected funnel, almost hidden in rain, moved northeastward near Anton about 3 p.m. destroying a tenant house. About half-an-hour later another twister, unconfirmed, dipped down on a farm two miles south of Carlisle and smashed a tractor shed, lifted, then dipped down again about a quarter of a mile east where it demolished an overhead water tank. Hail which accompanied the storm shredded growing cotton in a wide radius. Heavy local rain showers inundated some highways in the South Plains area for short periods and filled "wet weather lake beds." In the Canyon, Hereford, Amarillo area heavy rain showers preceded by whirling dust caused some local flooding. In McLean lightning damaged 4 homes. No one was injured.

On the 18th thunderstorms and turbulent weather moved into south Texas and far west Texas. A tornado was spotted west of Alice at 8 a.m. but dissipated with no damage being reported. Widespread shower activity spread as far as El Paso, where a thunderstorm with gusty winds and locally heavy rains snapped power poles and tore the roof off a bath house in one section of town.

On the 19th thunderstorms and turbulent weather continued in south Texas. A suspected tornado was reported six miles east of Sinton. The wind was estimated "so strong a man could not walk in it." Two men were injured slightly as a 13 x 18-foot sheet iron building was destroyed. Later that afternoon a heavy thunderstorm caused some street flooding in San Antonio.

On the 21st late-building afternoon thunderstorms formed along a line from Hobbs, New Mexico, to northeast of Lubbock. Heavy rains, hail, high winds and a brilliant electrical display broke out of the thunderheads. Hail beat down 500 to 700 acres of cotton north of Amherst and 250 acres of cotton and grain were ruined 7 miles south of Plains. Heavy rains closed roads in the Sudan-Denver City region. Another road was closed near Abernathy.

On the 22nd turbulent weather moved down state, extending in a band about 10 to 15 miles wide from Sweetwater to Kermit. A twister about 2 miles west of Big Spring overturned a car and trailer injuring one person. Two softball players suffered shock when a lightning stroke struck near them. Hail, rain and winds estimated at 50 mph hit Colorado City smashing plate glass windows. Trees were blown down as water flowed curb deep. About 20 miles south of Big Spring 8 to 10 inches of water was standing on U. S. Highway 87. Lightning set two 55,000-barrel oil storage tanks afire near Midland. Thundershowers extended westward into the Pecos Valley.

Richard D. W. Blood
State Climatologist
Austin, Texas

(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER. MAX AND MIN IN TABLE 6 REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

See reference notes following Station Index.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas, or to any Weather Bureau Office near you.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables; but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

NWRC, Asheville, N. C. -- 8-9-56 -- 1655

CORRECTIONS

February 1955:	Beeville, Table 2, precipitation departure should be -0.20.
	Weslaco 2 E, Table 6, wind from 1st through 28th should be 119, 61, 127, 106, 60, 65, 84, 27, 66, 82, 120, 43, 105, 49, 80, 123, -, 161, 141, 117, 88, 66, 17, 58, 46, 121, 151, 151, and total should be 2420B.
April 1955:	Lubbock, Table 2, precipitation departure should be -0.94.
July 1955:	Madisonville, Table 2, precipitation departure should be -0.97.
September 1955:	Beeville, Table 2, precipitation departure should be -0.41.
	Graham, Table 2, precipitation departure should be +3.95.
October 1955:	Beeville, Table 2, precipitation departure should be -1.40.
February 1956:	Vega, Table 2, all precipitation and snowfall data should be missing.
	Vega, Table 3, precipitation for the 1st to 8th inclusive, and the total should be dashes.

ASHEVILLE: 1956

TEXAS - JULY 1956

WEATHER SUMMARY

Scorching hot dry weather wilted the cotton, curled the feed crops, burned the pastures, and faded the hopes of farmers and ranchers over a steadily widening area with the situation most critical over the central, southern, and many western counties.

Hot weather persisted throughout the month of July. Temperatures at Fort Worth soared to 96° or higher every day of the month and on twenty days they reached 100° or higher. Daily maximums of 100° or higher were reached on twenty-four days at Laredo; the lowest daily maximum was 96° on the 26th. The temperature reached 100° or higher on every day except four at Presidio and on all days except two at Wills Point. Daily mean temperatures at Dallas were above the daily normal throughout the month except on the 20th when the mean temperature equalled the normal. Temperatures at a few high elevation stations and at stations along the Gulf did not reach 100° during July. The highest temperature for the State, 112°, occurred at Wills Point on the 9th. Daily minimum temperatures were mostly in the upper 60's and in the 70's. The lowest temperature for the State, 55°, occurred at Mount Locke on the 2d and at Canyon on the 24th. Monthly mean temperatures ranged from 71.6° at Mount Locke to 89.9° at Wills Point. Monthly mean temperatures were above the long-term means except at a few widely scattered stations. The largest positive temperature departures were in the northeastern counties. Temperature departures ranged from -2.0° at Mission to +6.5° at Wills Point.

Widely scattered thundershowers occurred on many July days. They brought temporary relief to some localities but hot southerly winds sapped the moisture quickly. Daily totals at a few stations exceeded two inches during the first part of the month and on a few later dates but such amounts were quite unusual. Monthly totals exceeded two inches in scattered areas and several stations received more than five inches of rain during the month. The greatest monthly total, 8.40 inches, fell at Booker. At the other extreme, numerous stations received not even light sprinkles during the entire month. The arithmetic mean of the monthly totals was slightly more than one inch. The same few isolated spots which received generous showers during July exceeded their long-term means for July. Far wider areas received less than half the long-term means. Most stations in the eastern Panhandle received more than their long-term means but over the rest of the State, the localities which received generous showers were widely scattered making the general precipitation pattern difficult to recognize. This characteristic is shown by the chart on pages 185 and 186.

Critical drought conditions intensified and spread throughout most of Texas. Crop prospects, already poor on July 1st, continued their downward trend. The season was especially disastrous in south central Texas, the lower Blacklands, the southern Low Rolling Plains, and adjacent counties. Yields of corn, hay, peanuts, sweet potatoes, and broom corn were expected to be especially poor. Cotton and sorghum made excellent progress in the irrigated areas of the Trans-Pecos and the High Plains and were in fair to good condition in the Coastal Bend and Lower Valley. Pastures and ranges were bare over a large part of the State, especially in central, southern, and western counties where rainfall has been critically short throughout the spring and summer. In the areas where showers occurred, grass was fair to good but the pastures were weedy. Feed crops were very short over most of the State except in irrigated areas, some early south Texas districts, and in a few dry land areas of the High Plains. Rains were needed to revive grass and to bring on late hay. Stock water was short or exhausted and many farmers were hauling water for livestock. Cattle and calves showed very heavy shrinkage. Sheep were in poor condition in spite of regular supplemental feeding. Ground water levels declined and reached record low levels in Travis County, El Paso, and San Antonio. Many cities rationed their water supplies.

Weather Records Processing Center
U. S. Weather Bureau
Kansas City, Missouri

STORMS

At Rankin in Upton County on July 2d, winds estimated at 80 miles per hour destroyed one house and several garages. Several power lines were blown down and some fifty TV antennas toppled.

On July 3d, lightning struck two large oil storage tanks a few miles west of Pampa during a thunderstorm, destroying them and one other by fire. Lightning also damaged a clinic in Pampa and knocked radio station KPDN off the air.

Flooding in the Nueces River Basin during early July was due to locally heavy rains on July 2d and 3d. The rainfall was heavy in the Cotulla area and north to the upper Frio around Sabinal with some amounts of 4 to 5 inches being reported. Due to the extreme dry conditions, flooding was limited to the immediate area of heavy rainfall on the Nueces from just west of Cotulla to below Tilden Crossing. No damage was reported due to flooding, as most of the country affected is open ranch country.

On July 4th a squall line set off several tornadoes and severe thunderstorms over a wide area of West Texas, bounded by Canyon, Anson and Lamesa. A tornado was reported in Randall County, but its path was mostly over open country. Another tornado was reported touching the ground about 7 miles north of Anson. No damage was reported. Four small tornadoes were also reported near Lamesa, but evidently none of these touched the ground. In the same area, heavy hail damage to cotton was experienced in the Munger community and near Ackerly. In a large area centered around Hale Center heavy crop damage resulted from hail associated with severe thunderstorms. Several thousand acres of cotton were destroyed or badly damaged in Lamb, Hale, and Floyd Counties.

On July 5th at Opelika, in Henderson County, a trailer house was destroyed by fire resulting from lightning during a thunderstorm. A large water-cooling tower was also damaged by wind. Several barns were unroofed, and trees blown down.

On July 6th thundershowers developed around Dallas shortly after noon and moved on to Denton County. A brick wall fifteen feet high and one hundred ten feet long was knocked down by the winds, which reached 57 m.p.h. in gusts at WBAS Dallas, causing several thousand dollars damage to farm machinery. Boats were damaged, trees uprooted, and roofs damaged at Lake Dallas. About the same time in Hopkins County, winds from another thunderstorm blew away or unroofed a barn and several garages. Some hail damage also resulted from this storm. At Orangefield in Orange County about 6:30 p.m., a severe thunderstorm with high winds caused damage to several homes, crops and utility lines.

On July 8th a squall line extending across the state from Texarkana to New Mexico set off several severe thunderstorms. Thunderstorms, high winds, hail, lightning and tornado funnels were reported. Damage was heaviest in Childress, Cooke, Wilbarger, Wichita, Grayson, Denton, Fannin and Dallas Counties. At Pleasant Grove in Dallas County, four persons were injured when lightning struck a home. At Vernon a drive-in theater screen was blown down. Lightning caused three fires, one near Burkburnett and two at Gainesville. Moderate hail occurred at Bonham, Denison and north of Electra. Winds, as high as 84 m.p.h. at Childress, destroyed or damaged homes, garages and barns at Childress, Wichita Falls, Gainesville, Krum, Sanger and other places in the area. Three funnel clouds were sighted at Valley View, two at Gunter, where the roof of the railroad station was blown off, at Slidell, and south of Gainesville. All these funnels were aloft except the one at Gunter.

On July 14th a thunderstorm struck a residential section of Pecos. Wind destroyed several carports, damaged houses, and broke many windows.

(Continued on Page 172)
